ABSTRACT

The study was divided into three major phases: to develop a mathematics curriculum for educable mentally handicapped; to develop a measurement instrument to evaluate the children's learning at various cognitive levels; and to determine the relative effects of two instructional approaches (inductive and deductive), two forms of repetition (exact and varied) and two modes of representation (manipulative and non-manipulative) on the children's mathematical learning. Seventy two subjects from two elementary schools were selected and placed in one of eight program conditions. It was found that the total program, when IQ was allowed to vary, resulted in significant amounts of learning at various cognitive levels. Manipulative modes of application were noted as better facilitating synthesis level than did nonmanipulative modes of application. The inductive mode of presentation was felt to facilitate the learning of set operations better than the deductive mode, and the two forms of repetition equally facilitated all types of mathematical learning. Mathematics Curriculum Innovation and Evaluation for Educable Mentally Retarded

Introduction

This study was divided into three major phases to accomplish the following objectives: I. to develop a mathematics curriculum of programmed instruction for Educable Mentally Retarded (EMR) and to evaluate the program's effectiveness in facilitating EMR learning globally, at various cognitive levels, and within different mathematical areas; II. to develop a measurement instrument which could be used to assess EMR learning globally, at various cognitive levels, and within different mathematical areas; and III. to determine the relative effects of two instructional approaches (inductive and deductive), two forms of repetition (exact and varied) and two modes of representation (manipulative and non-manipulative) on the mathematical learning of EMR's globally, at each of six cognitive levels, and within various mathematical areas.

Review of Related Literature

In a recent survey, a random sample of teachers of the mentally retarded in the State of Wisconsin were asked which programs in mathematics they used with their pupils. The two mathematics programs most frequently chosen by these teachers were the Steck, Vaughn and McCormick-Mathers series respectively (Armstrong and Senzig, In Preparation). These programs, originally designed for use with normals rather than EMR's are quite traditional in content, scope, and instructional approach. Major emphasis is placed upon drill and practice on the basic facts of the four operations. The third most frequently occurring response was teacher-made materials.

Due to the lack of research evidence available on just what qualities or characteristics programs should have to better facilitate the learning of EMR's, there is little reason to make claims that the materials being used, although originally designed for children of "normal" intelligence, fail to maximize EMR learning potential. There is, however, accumulating evidence that the more modern (understanding) approaches to mathematical learning for normals has been overall more successful in facilitating mathematical learning than the more traditionally based approaches (Begle, 1969; Fennema, 1969). There is also evidence from literature in developmental psychology to indicate substantial developmental lag in the mentally retarded. For example, the EMR progresses much more slowly (Woodward, 1961) than the child of normal intelligence through

the developmental stages hypothesized by Piaget (Flavell, 1963). Consequently, one would expect that mathematics programs designed for the EMR should be adjusted to compensate for this lag in development. The EMR of chronological age (CA) seven to eleven would generally be in the pre-operational (intuitive) stage of development (Woodward, 1961) while normals of the same CA would be at the concrete operations stage.

Since children of normal intelligence at a younger chronological age, but at the pre-operational developmental stage have benefited from experiences with handling materials and playing games which involve matching of sets of objects and manipulating objects (Churchill, 1958), one would expect that the older, CA 8-14, mentally retarded child who would also be at the pre-operational stage of development would also profit from these experiences.

The children in the Churchill (1958) program experienced mathematical relationships through the manipulation of objects. This experiencing is similar to the enactive mode of representation present in other investigations. When comparisons were made of the enactive, pictorial and symbolic modes of representation (Bruner, et al., 1966) by administering a test to EMR's, the pictorial and symbolic modes were found easier than the enactive mode (Finley, 1962). These findings, however, have been challenged due to confounding of the types of test administration, individual versus group (Cawley and Goodman, 1967).

The enactive mode of representation for teaching EMR's relations and basic operations were found by Callahan and Jacobson (1967) to build an understanding of concepts in a stepwise, concrete fashion. Cuisinaire rods, the instructional medium used in this program, provided opportunities for the EMR's to explore more advanced mathematics than was usually attempted. Although no data were given to support the finding, Callahan and Jacobson (1967) report that the results achieved were definitely better than might have been achieved in the same time without the cuisinaire rods. It should be noted, however, that actual comparisons with other modes of representation were not made. Inferences about success of the enactive mode over other modes were certainly not confirmed by these reported studies.

A comparison of enactive versus pictorial and symbolic representational modes in an actual instructional program with Trainable Mentally Retarded (TMR) has shown the enactive mode of representation to be superior (Armstrong, 1969[°]). Pupils in this sample ranged in mental age (MA) from 28 to 56 months with a mean MA of 40 months.

Consequently, one of the questions raised in the current study was: Is mathematical learning of the 8-14 year old EMR affected by the mode of representation utilized in the teaching of mathematical concepts? In order to make comparisons, contrasting programs involving either enactive or pictorial and symbolic modes of representation were developed. This is described later in great detail (see Manipulative and Non-Manipulative packet development, p.7).

Another concern in the program development was implementation. There were two basic elements of concern since the program being developed was to be used for experimentation as well as instruction. The first concern dealt with experimental control. If teachers were used as implementors of the program, a great deal of training would have had to precede implementation in order to get the desired result and even then controlling teacher behavior consistently throughout the duration of the experiment would have been very difficult. Consequently, from an experimental point of view using a machine, the implementation character of which remains relatively constant throughout the duration of the experiment, was certainly deemed better.

The question was then raised as to whether or not total learning would be jeopardized by using teaching machines rather than teachers as implementors of the program. The results of some comparisons in this area suggested not (Blackman and Capobianco, 1965; Capobianco, 1966). When Blackman and Capobianco (1965) examined the relative effects of machine implementation and traditional teacher implementation on reading and arithmetic learning of mentally retarded adolescents whose average IQ was in the low educable range, no significant differences were found between the two groups except on one arithmetic test. On this test, a specially devised test, the machine implementation group scored better than the traditional teacher implementation group. Capobianco (1966) in a review of the research literature on the use of teaching machines with mentally retarded concluded that when teaching machines were found less superior this result was usually due to: poor quality programs, sterotyped text, or inadequate field testing.

Since programmed instruction utilizing teacher machines as implementors of the program has not been found to jeopardize learning and in some cases has been found to enhance learning and, furthermore, aids in eliminating much of the extraneous variation due to teacher variability, the program was developed to be implemented by teaching machines.

The ideal instructional method to use with the mentally retarded was also not clear from the reported research. Although a vast amount of research has been done contrasting various methods, two of the most consistently researched and theoretically based instructional methods, the expository (deductive)

3 ...

and discovery (inductive) methods, have been most frequently studied with "normal" pupil samples (Armstrong, 1968; Volume I). One of the more recently reported studies which contrasted these instructional methods using an EMR sample (Armstrong, 1968; Volume II) found no difference between the two approaches on global learning, learning at various cognitive levels or learning within different subject matter areas. These findings, however, have been questioned (Armstrong, 1969) on the basis of length of program, machine failure and lack of marked programming clarity between the two approaches. Consequently, a more thorough examination of these instructional approaches with the retarded with different machines (machines less subject to break-down) and better programming to maximize and emphasize basic differences between the two instructional approaches was suggested (Armstrong, 1969^a). Thus, a second question raised for investigation: Do inductive and deductive approaches to instruction differentially facilitate the mathematical learning of EMR's?

In order to study this question half of the lesson options were written following an inductive approach and half of the lesson options were written following a deductive instructional approach. This phase of the program development is described in detail later (see Development of Programming Inductive and Deductive Instructional Styles, p.6).

A third characteristic of programming for the mentally retarded which has been consistently supported verbally, but seldom validated is repetition of presentation. One form of repetition which has been utilized is exact repetition. This form has best been portrayed in the film, "One and Two and Three" (Wexler, n.d.). This film designed for mentally retarded, exactly repeats during the second half of the film what was shown during the first half of the film. Another form of repetition which is utilized quite frequently in mathematics textbooks is the varied form of repetition. In the varied form of repetition, specific problem types are repeatedly presented using different number examples. For example, in order to teach addition of single diget numbers the sums of which are greater than or equal to ten and less than or equal to nineteen, the following sequence of problems would be presented in the varied form of repetition:

Using the exact form of repetition teaching the same concept the problem sequence would be as follows:

A recent survey of teachers of the mentally retarded in Wisconsin showed that repetition factors were cited second to skills or content orientation factors as the main strong point of the textbooks these teachers were using in mathematics instruction (Armstrong and Senzig, In Preparation).

Even though repetition gets frequent support among practitioners, the term is generally not well defined. Whether an exact or varied type of repetition would be better in facilitating the mathematical learning of the mentally retarded is not known. When this question was examined with a small sample of Trainable Mentally Retarded, no global differences were found (Armstrong, 1969°). But, when forms of repetition were coupled with modes of representation (manipulative or non-manipulative) certain learning differences were found. The varied form of repetition better facilitated learning when coupled with a manipulative mode, while the exact form of repetition better facilitated learning when coupled with the non-manipulative mode (Armstrong, 1969°).

Similarly, when these two forms of repetition were examined with an EMR sample (Armstrong, 1969a), no global differences were found between the two forms of repetition, but when coupled with the two forms of instruction, inductive and deductive, differences were found. The exact form of repetition was found to better facilitate mathematical learning at the comprehension and analysis levels when coupled with the inductive form of instruction while the varied form of repetition was found to better facilitate these types of learning when coupled with the deductive form of instruction (Armstrong, 1969a). Since the Armstrong (1969a) study was plagued by certain limitations due to machine problems, and program construction, these results certainly need validation. Consequently, a third area of investigation was comparison of exact and varied forms of repetition, and exact and varied forms of repetition coupled with inductive and deductive approaches to instruction and manipulative and nonmanipulative modes of representation. The program development associated with these two forms of repetition is described in detail later (see Programming Two Forms of Repetition: Exact and Varied, p.7).

Program Development

The present program was devised in part from previously developed programs (Armstrong, 1968; Volume I and II). The general content or topic outline (see Table 1) was an extension and revision of the earlier program outlines. The first program developed for pupils of normal intelligence (Armstrong, 1968; Volume 1) consisted of twenty lessons of similar topics, but was implemented by teachers. Consequently, the basic content within topics was written at a higher level and explicit teaching of place value concepts was not included. The second program (Armstrong, 1968; Volume II) designed for EMR incorporated only the first ten lessons, thus, covering only a portion of the content covered in the current program. Even so, most of the scripts of the first ten lessons were rewritten to better maximize differences between the inductive and deductive styles and in order to improve the overall language of the scripts.

After the topics for the twenty lessons were decided upon, program examples were made up for each lesson. The program examples consisted of slide descriptions of what was to be shown to teach each concept within each lesson. Generally, due to the length of the lessons (each 30 minutes in length) only one major concept was taught in each lesson. In general, the slide examples written for the first ten lessons (Armstrong, 1968; Volume II) were used in this program. New examples were devised, however, for lessons 11-20. After designing the slides for each lesson, descriptions of the art work were made up and sent to the artists. The artwork was subsequently photographed and made into 35mm color slides. In total, over 3,000 slides were used in this program (see Appendix I, Master Slide List). The listing in Appendix I gives the identification number and brief description of each slide used in the program.

Programming of Inductive and Deductive Instructional Styles. Scripts were then written in two different instructional styles to accompany the instructional episodes portrayed by the slide examples. The inductive style was characterized by beginning the instructional episode with a problem or puzzle and proceeding with specific examples which exemplified this problem. Questions about each example situation were asked. Pupils were encouraged to draw their own conclusions. The inductive script for Lesson One is shown in Appendix II. The numbers in the script refer to slides. Descriptions of the slides by number are given in Appendix I.

The deductive style was characterized by a more "telling" approach. Each instructional episode written in the deductive style began with a statement of the fact, concept or generalization to be taught. Each example was used to further illustrate

and clarify the fact, concept or generalization. The deductive script for lesson one is shown in Appendix II. Again, the numbers in the script refer to the slides which are described in Appendix I.

Manipulative and Non-Manipulative Packet Development. After approximately every two instructional examples in the programmed scripts application activities were introduced. Both manipulative and non-manipulative application packets were designed for each lesson. Packets which occurred at the same point in the instructional sequence were matched in terms of task and concept coverage. The only difference between the two packets was that the manipulative packet was made up of tasks involving the enactive mode of representation while the non-manipulative packets were made up of tasks involving pictorial and symbolic modes of representation exclusive of enactive modes of representation. All of the materials which the pupil would need to complete the application tasks, manipulative or non-manipulative, were placed in large brown envelopes and numbered sequentially for use in each lesson. Directions for completing the task associated with each application packet were included in the lesson scripts (see Lesson One, Appendix II). After completing the task pupils were asked to put the things back into the envelope and place it on the floor. They would then push a button to restart the tape and go on with the instructional sequence. The reinforcement statements following each application task were matched from manipulative to non-manipulative in order to equalize reinforcement effects across program options.

Programming Two Forms of Repetition: Exact and Varied.
The exact repetition option was achieved by exactly repeating the first half of the lesson presentation during the second half of the instructional period. The varied form of repetition was achieved by making up new and different examples to teach the same concepts during the second half of the lesson. The exact and varied form of repetition are illustrated in Table 2. A more detailed illustration is given in the actual scripts for Lesson One (see Appendix II).

Editing and Colating of Slide-Tape-Packet Programs. For each of the twenty lessons (see Table 1), there were eight different instructional-curricular-media options constructed:

1. Inductive-Exact-Manipulative, 2. Inductive-Exact-Non-manipulative, 3. Inductive-Varied-Manipulative, 4. Inductive-Varied-Non-manipulative, 5. Deductive-Exact-Manipulative, 6. Deductive-Exact-Non-manipulative, 7. Deductive-Varied-Manipulative, 8. Deductive-Varied-Non-manipulative.

Are these dishes on a breakfast table. Are these dishes alike in any way? We can see that all the dishes are the same color, but is color the best reason for putting them together in a group? Are the plates, dishes? Are the bowls, dishes? What is the best reason for putting the plates, the cups, and the bowls together in a group?

25 Here is a group you often see. What are the members of this group? Why are the girls members of this group? Why are the boys members of this group? Are the boys children? Are the girls children? Do we put these girls and boys together in a group because they are all children?

*Mumbers refer to slides; Number 2 set of dishes; Number 25 set of boys.

The scripts were recorded on audio tape and inaudible signals were programmed into the tapes to signal stops and slide changes. The appropriate slides were loaded into Kcdak Carosel Slide Trays for each of the eight options for the twenty lessons thus making a total of 160 different instructional episodes. The appropriate packets designed to accompany each instructional episode were packaged with it. The Avidesk Teaching Machine was used to implement the program.

Test Development and Evaluation

Since there were no published instruments available for the assessment of mathematical performance of EMR's at various cognitive levels on all of the programs presented concepts, an instrument had to be developed. Although some preliminary work had been done by Armstrong (1968; Volumes I and II) in developing such an instrument, items had not been written to cover all of the concepts which were to be taught in the present program. Therefore, additional items were written to add to the total item pool. Items within the item pool were classified and placed into categories according to cognitive level and lesson number. Then, thirty items were selected for use on the pre-test and sixty items selected for use on the post-test.

Due to the desire to minimize the effects of reading on test performance, the items were recorded on audio tape. Slides were used frequently to minimize verbalism. Both the pretest and post-test were programmed for use on the teaching machines. Thus, the administration of the test was standard for all subjects.

Pupils answered the questions on digetek (machine score) answer sheets. All questions were multiple choice. Individual cards printed with each item were available for the pupils to use so that they could follow along as the test items were read to them. The total post-test is shown in Appendix III. The first 30 items of the post-test were used as the pre-test.

The reliabilities, calculated using the Hoyt (1951) internal consistency procedures, and standard errors of estimate for the pre, post-total and post-cognitive level subtests are shown in Table 3. The reliability of the post-total test was similar to that found by Armstrong (1968; Volume II). A comparison of the reliabilities of the cognitive level subtests for the present test with those reported earlier by Armstrong (1968; Volume II), revealed that the reliabilities of the current subtests were slightly higher.

TABLE 3
SUMMARY STATISTICS FOR TESTS AND SUBTESTS

Test or Subtest	Number of Items	\overline{X}	S	Reliability	Standard Error
Post-Total	60	22.66	6,58	.70	<u>+</u> 3.46
Pre-Total	30	10.52	3.04	.36	<u>+</u> 2.48
Post Subtests:					
Knowledge	10	3.20	1.67	.31	<u>+</u> 1.30
Comprehension	10	3.73	1.66	.33	<u>+</u> 1.33
Application	10	4.04	1.77	.23	<u>+</u> 1.36
Analysis	10	3.50	1.62	.13	<u>+</u> 1.36
Synthesis	10	3.98	1.53	.12	<u>+</u> 1.33
Evaluation	10	3.71	1.72	. 32	<u>+</u> 1.37

A survey of the post-test item difficulties revealed, however, that many of the items were too difficult (see Table 4). To maximize the overall and, thus, subtest internal consistency reliabilities, the ideal item difficulty should be approximately equal to .50 (Tate, 1955). Items in this test ranged from ten to seventy-five per cent in difficulty.

The average difficulty and discriminatory power of the items within each of the cognitive level subtests were quite similar (see Table 5). Thus, any differences found among cognitive levels of learning could not be attributed to basic item characteristic differences.

In contrast, within content areas there were basic item characteristic differences (see Table 5). The place value and addition items, for example, had much worse item characteristics than the geometry items. When the ten worst items and ten best items on the basis of item characteristics were listed (see Table 6), these differences were even more apparent. The reason the geometry items had better item characteristics than the place value items was due to simplicity and lack of task abstraction. For example, items 22 and 53, which are very similar in construction one assessing knowledge of within-class congruence the other between-class congruence, asked in simple statement form a single question and then four picture responses followed. In contrast, the two place value items number 17 and 56, required a regrouping of objects mentally and the identification of a response in word form, thus requiring abstraction and translation before response.

A better statement of these items would have been a more direct question with the response options in picture form (see Figure 1). Five separate slides should have been made so that the pupils could see first just the item stem, in this case the illustration of 3 hundreds, 2 tens and 12 units, then, each item response choice, A-D, added one at a time to the total picture, the final slide showing the stem and all four item response choices as shown in Figure 1.

The simultaneous showing of all four item response choices would have undoubtedly improved the overall performance on many of the items. Too often, pupils forgot which response was associated with which letter when they were ready to write down their answer. In items 25, 26, and 37, (see Table 6) for example, when the correct response was the last response shown, more pupils answered the items correctly. In these cases the pupils only had to remember the response for 4 seconds. In cases where the correct response came earlier they may have had to remember the response for as long as 16 seconds. This seems to have made a difference.

This supports the hypotheses regarding the difficulty EMR pupils have in mentally retaining abstract symbols. Items 17, 28, 35, and 59 (see Table 6) were all characterized by requiring the retention and recall of symbolically stored information. The provision of paper and pencil or small magic slate with time to actually write out the problem and solve it in concrete form would have undoubtedly resulted in improved performance on these items. The addition of illustrations to the stated problem in item 35 would have increased performance without changing the concept being tested and, thus, improved the item.

It was difficult to determine why item 2 was such a poor item. The wording seems simple and straight forward and the response choices did not have to be remembered since they were on the printed item card. The item characteristics indicated, however, that the few pupils who did get the item correct were the pupils who received the lowest scores on the total test.

Item 23 was too subtle and wordy. A simpler stated question assessing knowledge of the same concept would have been:

- 23. The set of combs and the set of rubberbands are equivalent because they have:
 - A. the same members.
 - B. different numbers of members.
 - C. the same number of members.
 - D. different members.

Item 46, although quite wordy, would be difficult to change without changing the concept and/or the cognitive level at which this concept was to be evaluated. Perhaps having the printed words for each response on a slide rather than on the card only would have improved overall performance on this item. Item 52 would undoubtedly have been improved by having a single item response slide which showed the four item response choices simultaneously, thus, eliminating the need for retention and recall of item response choices.

Experimental Program

Sample. Seventy-two subjects of chronological age (CA) range of 8 to 15 and mental age (MA) range of 5 to 12 classified as educable mentally retarded were selected for participation from two elementary schools in the Madison Public School System. All pupils within these age ranges from these two schools were included in the sample except those children who had been in the Armstrong (1968; Volume II) program the year before. These subjects were eliminated since much of the material would be repetitious from the previous program and the effects of reten-

tion of concepts from the previous program on learning in the current program would be difficult to evaluate.

The frequencies of subjects per treatment condition cell after loss due to moving, prolonged illness, and truancy were: IVM-8, IVN-9, IEM-9, DVM-8, DVN-9, DEM-9, and DEN-7. Since equalizing the cells would necessitate the loss of eleven subjects, least squares unequal cells analyses were done. It was assumed that the results of these analyses would be more accurate.

Procedures. After the subjects were selected for participation they were randomly assigned to one of the eight program conditions. Two instructional mobile vans were set up, one at Emerson School and the other at Longfellow School. Comparisons between schools were made on mental age (MA), chronological age (CA), and post-mathematical achievement (see Table 7). Only slight discrepencies were found between the two schools. One school was made up of children of slightly higher CA and MA and, consequently, exhibited slightly higher mathematical achievement. The MA and CA range at Longfellow was greater, but seemingly Emerson pupils had characteristics similar to those of pupils in the lower MA, CA range in the Longfellow sample. Consequently, there seemed to be no reason to expect that the two samples came from different populations. Therefore, for the most part, generalizations were made across school samples.

Similarities on total mathematical achievement, CA and MA, however, did not preclude the possibility of school by treatment interactions. Therefore, to cross-check this possibility, analyses were done, blocking on the school factor.

Avidesk teaching machines were used in both vans to implement both the tests and the 20 lesson instructional programs. Monitors were used to load the teaching machines with the appropriate program option, add new materials to application packets between runs and to be sure the machines and programs were running properly. Monitors were encouraged to aid pupils in understanding tasks or getting objects out of and back into application packets. They were definitely discouraged, however, from stopping the machine and teaching the concept in their own style. This did occur from time to time, however. Hopefully, these instances were randomly distributed over treatment conditions and infrequent.

Although teachers were requested not to teach any other mathematics during the experimental program and agreed prior to the program implementation not to, observations on the part of the monitors proved the contrary. Arithmetic instruction outside the experimental program occurred at only one of the two schools, however, so some cross checks could be made. For the most part the assignments given to the children were pages

	67			

of addition, multiplication, subtraction and division problems. Since subtraction, multiplication, and division were not covered in the experimental program the effects on work in the experimental program would be in the addition area.

Undoubtedly, the approaches were quite different. The experimental program focused on an understanding of addition through emphasis on numeral quantity association and place value. The teacher oriented textbook approach focused on recall of specific facts through repetition of the facts by working pages of problems out of the textbook. The arithmetic taught by the teachers probably did not aid the pupils in answering most of the questions on the experimental test. Since drill facilitates recall rather than understanding (Brownell and Chazel, 1935), only four items in the addition portion of the test could have possibly been affected by this extraneous instruction. These items required only recall of specific facts.

There were nine addition items on the post-test; items number: 7, 13, 16, 24, 28, 45, 51, 54, and 59 (see Appendix III). Five of these items required comprehension, synthesis, or analysis level performance (see items 13, 16, 24, 54, and 59; see Appendix III). Performance on these items was probably unaffected by the drill and memorization practice in the classroom. Four of the items, however, were knowledge or application level items which may have been affected by drill and memorization practice in the classroom (see items 7, 28, 45, 51; Appendix III).

In order to examine the question of whether or not extraexperimental drill did have an overall effect on learning, the scores of the two schools were compared on these four items as well as globally (see Table 8). When total scores on the post-test were examined, no substantial differences were apparent. Later analyses revealed that there were no significant differences between the two schools on total learning (see Results and Discussion section, p.47).

In terms of individual item performance, however, the Longfellow group performed somewhat better on items 28 and 51 (see Table 8). On items 7 and 45, however, the scores were very similar. The greatest difference was on the basic fact item 51. This item required recall of the basic fact 5 + 6 = 11. It would be difficult to verify completely that this better performance was directly attributable to extra-experimental drill. It may have been due, for example, to pre-experimental knowledge as well.

Since pupils were randomly assigned to treatment conditions, the effects of this added practice were assumed to be evenly distributed across the various program options. The number of subjects in each treatment combination by school is shown in Table 9.

A pre (prior to instruction) test of thirty items (see Appendix III) was administered to all of the pupils by using the teaching machine and programmed directions. Pupils answered on machine score answer sheets. The pre-test was completed in two 20 minute sessions. After completing the pre-test, pupils took one lesson per day, approximately 30 minutes in length, of the mathematics program. After completing the twenty lesson program, a post-test of 61 programmed items was administered (see Appendix III). The first thirty items of the post-test were the same as the pre-test. Test and item statistics were previously shown and discussed (see Test Development and Evaluation section, p.10).

Program Evaluation

To evaluate the relative success of the 'Mr. Mathematics Program" in promoting EMR learning globally, at various cognitive levels and in different mathematical areas, pupil performance across all eight treatment options was examined. The relative power of the Mr. Mathematics Program in influencing EMR mathematical learning was investigated by examining several specific questions:

- 1. Did the Mr. Mathematics Program produce total mathematical learning?
- 2. Did the Mr. Mathematics Program produce mathematical learning at all cognitive levels?
- B. Did the Mr. Mathematics Program produce mathematical learning in all specified areas of mathematics?
- 4. Did the Mr. Mathematics Program differentially promote mathematical learning for different mental age groups?
- 5. Did the Mr. Mathematics Program differentially promote mathematical learning for different chronological age groups?
- 6. Were some lessons of the Mr. Mathematics Program better than others in producing mathematical learning?

Procedures for Program Evaluation. To answer question one, two statistical tests were computed, a t test for means of correlated samples on the pre-test scores and the post-test scores adjusted for item number by dividing by two, and a grand mean test on post-total mathematical achievement scores with pre-mathematical achievement as a covariate. All data analyses were done by computer using the Finn Version IV Program (Finn, 1968). To answer question two and three, multivariate analyses of covariance grand mean tests were computed and the appropriate overall F ratios calculated and evaluated for significance at the .05 level. When overall F ratios were found to be significant, univariate analyses and standardized discriminant function coefficients were examined for each of the subtests.

To answer questions four and five, univariate analyses on postmathematical achievement with pre-mathematical achievement as a covariate and multivariate analyses of covariance on mathematical area and cognitive level subtests with pre-mathematical subtests as covariates were computed on mental age and chronological age factors. The appropriate F ratios were computed and evaluated for significance at the .05 level. Again, when overall multivariate F's were found to be significant, univariate analyses and standardized discriminant function coefficients were examined for the individual subtests. To answer question six, a multivariate analysis of covariance was computed for the grand mean with post-mathematical by lesson subtests as the variates and pre-total mathematical achievement as the covariate. Univariate analyses and standardized discriminate function coefficients for all by lesson subtests were also examined.

Results of Program Evaluation

Question One: Total Mathematical Learning. The results of the t test for means for correlated samples and the grand mean test on post-mathematical achievement adjusted for premathematical achievement are shown in Table 10. Upon evaluation, both the t and F were found to be significant at or beyond the .001 level. It was concluded then, that the Mr. Mathematics Program did produce total mathematical learning for the Educable Mentally Retarded Pupils involved in this study.

Question Two: Mathematical Learning at Six Cognitive Levels. The results of the multivariate analysis of covariance on mathematical learning at six cognitive levels are shown in Table 10. The results indicate that the Mr. Mathematics Program did produce different amounts of learning at the various cognitive levels, (see Overall F ratio; Table 10), but yet produced learning at each cognitive level (see Univariate F ratios; Table 10). Mathematical learning was the greatest at the synthesis level. Synthesis level learning required the putting together of specific elements and parts so as to form a whole; it required the forming of a generalization. Mathematical learning at the comprehension, application, and analysis levels was quite similar (see SDF coefficients; Table 10). Seemingly, the least amount of learning took place at the knowledge and evaluation levels. The knowledge level required direct recall of specific facts. The evaluation level required judgments about the concepts and generalizations learned.

Question Three: Mathematical Learning in Specified

Mathematical Areas. The results of the multivariate grand mean
test on mathematical learning in specified areas of mathematics
indicated that different amounts of learning took place in

the different areas (see Overall F ratio; Table 10), but mathematical learning did take place in all six specified areas of mathematics (see Univariate F ratios; Table 10). The standardized discriminant function coefficients associated with the six subtests indicated that more learning took place in the relations, union and place value areas than in the sets, addition and geometry areas. Relations, place value and union were undoubtedly new areas of study for the mentally retarded. In general, mathematics programs used with the mentally retarded do not include explicit instruction in these areas.

Question Four: Differential Learning with Respect to Mental Age. The results of the multivariate and univariate on mental age are shown in Table 11. When total mathematical learning was considered, learning differences were found to be dependent upon the mental age level of the pupils involved. As would be expected, children in the high mental age group exhibited higher mathematical achievement than the middle mental age group; and likewise, the middle mental age group exhibited higher mathematical achievement than the low mental age group (see Table 12).

Mental age groups performed similarly at each of the six cognitive levels and within each of the six specified mathematics areas (see Table 11). Since differences were not found on performance at specific cognitive levels and within particular mathematical areas when three mental age groups were compared, the mental age group performance pattern would be assumed to be relatively uniform and consistent.

Question Five: Differential Learning with Respect to Chronological Age. To examine question five, subjects within the study were ranked according to Chronological age and placed in three groups, high, middle and low chronological age. Univariate and multivariate analyses of covariance were then computed on the chronological age factor.

The results of these analyses are shown in Table 13. No differences in mathematical learning were found with respect to chronological age. Therefore, it was concluded that the "Mr. Mathematics Program" equally promoted mathematical learning globally, at different cognitive levels, and in the specified mathematical areas for the three chronological age levels studied.

Question Six: By Lesson Analysis. The results of the multivariate and univariate analyses of covariance on post-mathematical, by lesson subtests is shown in Table 14. The results of these analyses indicated that the Mr. Mathematics Program did vary in its promotion of mathematical learning from lesson to lesson. Some lessons were better than others in promoting mathematical learning.

Lesson 20	2.3558	3.38	1,50	.0719	.5916

A plot of the standardized discriminant function coefficients associated with each lesson is shown in Figure 2.

The variance between lesson 3 and 4 was in part due to the type of items used to reflect each lesson. The objectives reflected in the chosen lesson 3 subtest items were knowledge (requiring recall of subset definition), and comprehension (requiring identification of a set and one of its subsets) level items. The objectives reflected in the chosen lesson 4 items were application (identification of a set which could not be a subset of a given set), analysis (identification of elements which could not be members of a subset of a given set) and synthesis (identification of the original set of a given subset) level items.

Even so, the lessons themselves were designed to teach the same concepts, so the reflection of differences between lessons was the difference between presentation (wherein designated lesson 3 concepts were taught) and application (wherein lesson 4 concepts were taught) program sections of the two lessons combined.

The most obvious problem with the application tasks (reflected by lesson 4 designation) was the incorrectness of one of the answer slides associated with one set of the application packets. Pupils were shown a set of bleep, a blop, and blip (see Figure 3). They were asked to draw on the answer sheet all of the possible subsets of the set of a bleep, a blop, and a blip. The answer slide shown was incorrect (see Figure 3). The correct answer slide is also shown in Figure 3.

One of the other application tasks was equally as confusing to the pupils due to the lack of clarity in the correct answer. In fact, on this particular application task, none of the pupils got it correct. Pupils were given a work sheet with a set of animals: a cow, a pig and a horse (see Figure 4). Pupils were given six different colored crayons and asked to circle all of the different subsets. This worked fine for the first two subsets, but was disasterous thereafter due to the confusion of lines (see Figure 5).

Two other application examples used in the subset lessons are shown in Figure 6 and 7. Pupils were asked to identify specified subsets of the given set (e.g. subset of those dominoes whose dots on both sides sum to four).

The referent in this case was too broad and complicated and thus, the task was not successfully completed by the majority of the students.

These problems in programming undoubtedly led to the subset learning problems associated with items used to identify lesson 4. The concepts which the pupils were successful on were associated with the presentation or instructional phase rather than the application phase which in these lessons was very poor. The success reflected on lesson 3 (due to the items selected to represent lesson 3) can be attributed to the instructional phase of the two subset lessons.

Two other lessons were reflected in the data analysis as being in need of improvement: Lessons 17 and 19 (see Figure 2). Subtest items for lesson 17 were: 51, 7, and 54. In comparing these lesson 17 items with Items 24, 28 and 13 selected for lesson 15 and Items 16, 59 and 45 selected for lesson 16 subtest (see Appendix III), it was apparent that the items selected to represent lessons 15 and 16 focused more on comprehension of the addition process and how place value (regrouping and renaming) was utilized in the addition process while the items selected to represent lesson 17 focused primarily on straight application (solving of addition problems).

The major focus of the Mr. Mathematics Program was to supplement the typical EMR mathematics program of application and drill on addition, subtraction, multiplication and division with new content areas, geometry, sets and relations with major emphasis on understanding of mathematics rather than on the direct application of memorized facts. It was of interest to note here, however, that the programs pupils had been involved in before had no more effect than they did on attaining a correct final answer on straight addition problems.

The implications for revisions in the Mr. Mathematics Problem are apparent. More practice should be provided in the application packets in working addition problems. The primary emphasis of the present packets was an understanding of place value. This should not be removed, but rather additional packets added.

The results of the experimental field trial indicated that lesson 19 also needed improvement. The objectives of this lesson were directly reflected in the selected subtest items used to represent it. The concept being taught in this lesson was within class congruence. One of the problems which pupils had with this concept was their inability to perceive and discriminate size differentiation. Consequently, certain readiness activities should have accompanied this lesson for this particular group. Whether this characteristic, difficulty in size discrimination, is prevalent among all EMR pupils would certainly need to be investigated further. If it were a prevalent problem among EMR's, then steps to provide readiness material prior to lesson 19 should be added to the present Mr. Mathematics Program.

Results and Discussion

The purpose of the experimental phase of this study was to develop a series of EMR mathematics programs which differed on three major dimensions, repetition, instruction and mode, and to assess the influence of these curricular and instructional factors in affecting mathematical learning globally, at each of six cognitive levels, and in different areas of mathematics. Extraneous factors such as IQ, MA, CA, and school were also examined in relation to the curricula-media variables and learning.

Experimental Design. A 2x2x2 completely crossed randomized block design was utilized with unequal numbers of replicates per cell. The four factors, instruction (1) with two levels, inductive and deductive, repetition (R) with two levels, exact and varied, and mode (M) with two levels, manipulative and non-manipulative, and school (S) with two levels, Emerson and Longfellow, were all considered to be fixed rather than random. Therefore, the within cell mean square was used as the error term. The .10 level of significance was set as acceptable.

Statistical Analysis. Univariate analysis of covariance procedures were utilized to analyze the total score data and multivariate analysis of covariance procedures were utilized to analyze the cognitive level and subject area subtest data. All data analyses were done on computer using the Finn Verision IV Program (Finn, 1968). When overall multivariate tests were found to be significant, univariate tests and standardized discriminant function coefficients were utilized to locate the specific sources of variation contributing to or causing this overall difference. Directions of differences were inferred from the adjusted means.

Total Mathematical Learning. The results of the univariate analysis of covariance on total mathematical achievement with IQ and pre-mathematical achievement as covariates are shown in Table 15. When IQ and pre-mathematical achievement were used as covariates, the effects found to be significant at the .10 level were regression, instruction by repetition (IR) and repetition by mode (RM) (see Table 15).

The repetition factor although strongly supported verbally by the practitioner has gained little support experimentally (see Table 10). Consistently, (Armstrong, 1968, Volume II; Armstrong, 1969) this factor has not been found to be significant.

Mode was not found to significantly affect total mathematical learning. The results of an earlier study, however, (Armstrong, 1969), showed that mode was a critical factor in the learning of numeral-quantity associations by the TMR. The differences in the findings between the two studies are probably attributable to either of two factors, (1) mental age differences between the two samples or (2) mathematical content differences between the two programs used.

The mental age range of the pupil sample in this study was 5 years 8 months to 11 years 9 months while the mental age range of the TMR study (Armstrong, 1969) was 2 years 4 months to 4 years 8 months. Certainly, the interaction of mental age and mode of representation should be explored as a reasonable possibility. Seemingly, if mental age accounts for this difference the mental age range of 2 years 4 months to 5 years 8 months should be carefully scrutinized. An exploration of mode by mental age interaction effects in the range of 5 years 8 months to 11 years 9 months revealed no significant differences.

The instruction by repetition factor was found to be significant (see Table 15). The inductive approach was found to form a better combination with the varied form of repetition while the deductive approach was slightly better when coupled with the exact form of repetition (see Table 16).

The IR factor was not found to be significant in the Armstrong (1968; VolumeII) study. Again, this lack of significance may have been due to the length of the program (i.e., ten lessons as compared to twenty), the differences in mathematical content, and/or programming or machine problems in the previous study. Seemingly, when using a more telling approach exactly repeating the presentation does enhance the learning, but when using a more inductive or discovery-type approach a variety of examples enhances learning.

The repetition by mode factor was also found to be significant at the .10 level (see Table 15). The means indicated that the manipulative mode combined with the varied form of repetition and the non-manipulative mode combined with the exact form of repetition resulted in greater overall learning than did the other two repetition and mode combinations (see Table 17). This result is the same as one found by Armstrong (1969°) with trainable mentally retarded.

^{1 (}Mental Age by Mode Interaction Effect Mean Square = .99, F=.03, = p<.9692).

	Deductive-Varied	20.66	21.03		

TABLE 17

ORIGINAL MEANS AND MEANS ADJUSTED FOR IQ AND PRE-MATHEMATICAL ACHIEVEMENT ON POST-MATHEMATICAL ACHIEVEMENT FOR REPETITION AND MODE COMBINATIONS (N=67)

Repetition x Mode			Raw Regression Coefficient	
Combination	Original	Adjusted	Pre-Achievement	ĪQ
Manipulative-Exact	20.92	20.77		
Non-Manipulative-Exact	23.16	21.67	.88	.18
Manipulative-Varied	24.14	24.91		
Non-Manipulative-Varied	20.98	21.85		

Seemingly, the abstract nature of non-manipulative materials is compensated somewhat by the exact repetition of the presentation. In contrst, the concrete nature of the manipulative materials provides enough learning momentum to make it possible for the pupils to experience a change in presentation without learning loss. This conclusion must also presuppose that the exact form of repetition jeopardizes learning when manipulatives are involved and the varied form of repetition jeopardizes learning when non-manipulative materials are involved. Seemingly, there is an underlying cognitive development scheme in operation. Variety coming too soon in the cognitive process development and exact repetition coming when the developmental process is complete can be a hindrance to learning.

Mathematical Learning at Six Cognitive Levels. When mathematical learning was examined at six cognitive levels in terms of the various treatment combinations, the results varied somewhat for the mode factor, depending upon the choice of covariates (see Tables 18 and 19). Consistently, no significant differences were found on all other factors.

When pre-cognitive level subtests were used as covariates, mode was found to be significant at the .10 level (see Table 18). An examination of the univariate tests by subtest and the standardized discriminant function coefficients associated with the two analyses (see Table 20) indicated that this overall difference was concentrated primarily at the synthesis level of learning. An examination of the adjusted means indicated that the manipulative mode was better than the non-manipulative mode in facilitating synthesis level learning (see Table 21).

Although when IQ was added as a covariate the mode factor on the overall multivariate F test was no longer significant (see Table 19), the results of the univariate test for synthesis level learning differences were more pronounced (see Table 20). Mathematical learning at the synthesis level for the mode factor on the univariate test when IQ was used as a covariate was significant at the .0030 level (see Table 20). The standardized discriminant function coefficient associated with synthesis level learning was also large in both cases. Again, an examination of the means (see Table 21) when adjusted for IQ indicated that the manipulative mode better facilitated mathematical learning at the synthesis level than did the non-manipulative mode.

Mathematical Learning in Different Areas. Instruction (I), Instruction by Repetition (IR), and Instruction by Mode by School (IMS) were all found to differentially affect the mathematical learning of sets, relations, set union, place value, addition and geometry (see Table 22).

The univariate analysis on each of the six content area subtests for the Instruction factor is shown in Table 23. The content concerned with the unioning of sets seemed to be the area most affected by the instructional approach used. An examination of the means and standardized discriminant function coefficients (see Table 24) indicated that the inductive approach was better than the deductive approach in teaching set union. This finding complements an earlier finding with a normal sample (Armstrong, 1968; Volume I). The inductive approach was found to better facilitate the learning of operations. These included set union as well as other set and number operations.

The Instruction by Repetition (IR) Factor was also found to be significant (see Table 22). The IR factor when examined by individual subtest analyses and standardized discriminant function coefficients (see Table 25) seemed to primarily affect learning in the areas of relations, set union, and place value. The adjusted means within these areas indicated that the directions of the effects were consistent with that found for total learning (see Table 26). The inductive approach was better coupled with the varied form of repetition and the deductive approach was better coupled with the exact form of repetition and the sum of these two combinations was significantly better than the inductive coupled with exact and the deductive coupled with varied forms of repetition (see Table 26).

The Instruction by Mode by School Factor was also found to be significant on the overall multivariate test (see Table 22). The interaction of instruction and mode with school was most probably reflecting an interaction of instructional mode and content with mental age rather than any real school factor. An examination of the univariate tests and standardized discriminant function coefficients (see Table 27) indicated that the learning of number relations was the primary area affected. In the learning of relations, comparatively Emerson pupils did better under the indictive-manipulative combination than under the other three combinations (see Table 28; Figure 8). Longfellow pupils did better under the deductive-manipulative and inductive-nonmanipulative combination than under the other two combinations.

Summary and Conclusions

The objectives of this study were: 1) to develop a mathematics curriculum of programmed instruction for EMR's and to evaluate its effectiveness in facilitating global learning, learning at various cognitive levels, and learning in different areas, 2) to develop an evaluative instrument which would reliably assess mathematical learning at globally, at various cognitive and with different mathematical areas, and 3) to determine the relative effects of two instructional approaches (inductive and deductive), two forms of repetition (exact and varied) and modes of representation (manipulative and non-manipulative) on the mathematical learning of a selected sample of pupils classified as educable mentally retarded (EMR) of CA range 8-12.

Program Development and Evaluation. Much seemed to be gained in the addition of application packets to the overall program. The involvement of the pupils in an applied task seems to be essential in keeping attention and making the presented mathematical concepts more concrete. Pupils were quite motivated by the enveloped tasks and looked forward to them during the instructional sequence. Certainly, a fruitful avenue of exploration in program development would be the determination of the profitable balance between work task involvement and formal presentation.

The total program when IQ was allowed to vary resulted in significant amounts of learning globally at various cognitive levels and in different mathematical areas. The program was most successful with the higher range MA group, and less successful with the middle and lower range MA groups respectively. Seemingly the mental age range for which this program was best designed was the 8-12 year MA range. This result, however, may be due to the difficulty levels of the test rather than explicit learning difficulties of the lower MA range pupil with this particular program.

Several suggestions for revision and addition are apparent as a result of the field trial. In general, the suggested revisions and additions were: 1) for more application tasks dealing with addition practice, 2) correcting obvious answer slide errors, 3) simplification of the skills involved in application task completion and 4) provision of certain readiness materials or subprograms on size discrimination tasks.

Another revision which would aid in individual lesson evaluation would be the programming of the by lesson subtest items as part of the lesson packet. This would facilitate interpretation by equalizing length of recall.

75

Test Development. One of the more difficult aspects of the test development is the construction of easy items. The development of the present test was a case in point. Many of the items were too difficult. This occurred sometimes from a technical base, inability of the pupils to view all four item response choices simulataneously, sometimes from a wording problem and other times from the unnecessary requirement of mental retention of symbols. Undoubtedly, if these aspects of the test were changed, the test would be improved.

Experimental Phase. Mathematical learning was differentially promoted for these EMR's as a function of certain curricular and instructional factors depending upon what mathematical area they were studying and the cognitive level at which they were required to respond.

The manipulative modes of application better facilitated synthesis level learning than did the non-manipulative modes of application. The inductive mode of presentation better tacilitated the learning of set operations than did the deductive mode of presentation. The two forms of repetition, exact and varied, equally facilitated all types and levels of mathematical learning.

The inductive mode of instruction combined with the varied form of repetition was better on global learning and the learning of relations and set union than the other instructional mode and repetition form combinations. The deductive mode of instruction was better coupled with an exact form of repetition. The varied form of repetition better promoted learning when combined with a manipulative mode of application. The non-manipulative mode of application was found to better combine with the exact form of repetition.

APPENDIX I.

MASTER SLIDE LIST

Slide Number	Description
1	Mr. Mathematics with basket of numbers, basket of sets,
	and basket of shapes
2	set of dishes
2 g	set of 8 disher
3	set of golf clubs
3 g	set of golf clubs
4	empty set
5	baby
5 6 7 8	set of swings
7	one of swings
8	set of swings / one of swings
9	set of pets
9 g	pets
10	dog
11	cat
12	bi rd
13	set of pets / dog
14	set of pets / cat
15	set of pets / bird
16	set of fruit
17	apple
18	orange
19	banana
20	grapes
21	set of fruit / apple
22	set of fruit / orange
23	set of fruit / banana
24	set of fruit / grapes
25	set of five boys with different shirts
26	boy with white shirt
27	boy with purple shirt
28	set of five boys / boy with white shirt
29	set of five boys / boy with purple shirt
30	set of six balloons
31	blue balloon
32	set of balloons / yellow balloon
÷ 33	set of seven books on table
33 g	set of 7 books on table
34	red book
35	green book
36	set of books / red book
37	set of books / green book
38	set of coins
3 9	nickel
40	dime
41	set of eight coins / nickel
42	set of coins / dime
43	set of nine pencils
	0.0

```

Slide Numbe	r Description
212	two yellow cats / three black and one white cat
213	sheet of white paper with SUBSETS printed at bottom.
_	Above are six squares: one containing 1 red block,
	I with one yellow block, I with one green block, I
	with a red and argreen block, another with a green
	and a yellow block, and the last with a yellow and a
_	red block
214	White paper with SUBSETS at top. Three squares one
	containing a blip, one a blop, and one a bleep. 3
	rectangles: one with a blip and a blop, one with a
0	blop and a bleep, and one a bleep and a blip
215	ditto 014, cow with circle around it, pig with a circle
216	around it
210	sheet of white paper, a pig on one half, a cow on the other half
217	sheet of white paper divided into 3 squares and 3 rec~
-17	tangles: one square contains a pig, one a cow, one
	a horse. One mectangle has a pig and a cow, enother
·	a cow and a horse, and the last a horse and pig
218	ditto 015, with green circle around the cow and the horse
	blue circle around the pig and the horse, red circle
• • • • •	around the pig and the cow, a black circle around the
	pig, a yellow circle around the horse, an orange circle
. 0.10	around the cow.
-	4 green blocks matched with 4 blue blocks plus one extra green block
220	ditto 016, red lines drawn from 4 children to 4 chairs,
	l extra child
221	pegboard with red pegs down far right and five green
	peg down for left, 5 rubberbands, each stretched
	between a green and a red peg
222	ditto 017, each vase with a flower drawn in it
223	magnetic mat with 4 magnetic shapes matched to 4
	magnetic fruits, l extra fruit
224	ditto 18, 4 footballs drawn in space C and a line drawn
	from each boy to each football. Either 2 or 4 dolls
	drawn in space D with lines joining girls and dolls
20-	so there is 1 extra girl or doll.
225	5 large yellow plastic beads and 5 large blue plastic
226	beads joined in pairs of 1 blue and 1 yellow ditto 019 with an apple drawn on each plate
227	piece of blue paper with 3 soap animals / 6 paper cups
221	white card which says 3 < 6
228	ditto 021, cups green, dog brown, note card which says
	3 < 6
229	board with 4 padlocks with keys hanging. There is an
_	extra key. Card which says 4<5
230	ditto 022, lines drawn between 4 padlocks and 4 keys,
	1 extra key at bottom of page: 4 5

vi

Slide Number	Description
231	blue board with two wooden pegs, 4 green squares on left peg, 7 yellow squares on right peg, card which says $4 < 7$
232	ditto 023, 4 green squares on left peg, 7 yellow squares on right peg at bottom of paper $4 < 7$
233	7 nuts with 7 bolts fastened to them, 1 extra bolt, card which says 7 < 8
234	ditto 024, lines drawn between 7 nuts and 7 bolts. There is 1 extra bolt. Underneath bolts: There are 8 bolts. Underneath nuts: There are 7 nuts. At bottom of page $7 < 8$

LESSON ONE: ILLUSTRATIVE
SCRIPTS SHOWING EIGHT
CURRICULAR, INSTRUCTIONAL, MEDIA
OPTIONS

LESSON ONE: INDUCTIVE-VARIED MANIPULATIVE INTRODUCTION TO SETS

- Hello! I want you to meet Mr. Mathematics. He's going to help me show you some things about mathematics which you may not have learned before. As you can see, he has three baskets of mathematics: numbers, shapes, and sets. In Mr. Mathematics' first basket are numbers. You probably know about this kind of mathematics. Sometimes we call this kind arithmetic. There are two other kinds of mathematics you may not know about. In Mr. Mathematics' second basket are shapes. In Mr. Mathematics' third basket are sets. We'll be exploring the mathematics in each of Mr. Mathematics' baskets. We'll be studying numbers, shapes, and sets. Today we are going to talk about things you often see grouped together. Let's find out why we group some things together.
- We often see dishes on a breakfast table. Are these dishes alike in any way? We can see that all the dishes are the same color, but is color the best reason for putting them together in a group? Are the bowls, dishes? Are the cups, dishes? Are the plates, dishes? What is the best reason for putting the plates, the cups and the bowls together in a group?
- You may have seen these before on the playground. What are they? Why do we place the two swings together? Do we use the two swings for the same purpose?
- 7 Here is one of the swings. How do we use this swing? Do we swing in the swing?
- 6 Here is the group of swings. Do we use both swings for the same purpose?
- Beside your desk is a large envelope with the numeral one on it. Open the envelope. Put the three sheets of paper on your desk. There is one green sheet, one red sheet and one yellow sheet. Place the set of blocks on the green sheet. Place the set of dishes on the red sheet. Place the set of money on the yellow sheet.
- 106 Check your work. Do the three sets of yours look the same as the three sets in the picture. If your sets are not like the sets in the picture, change them to match the sets in the picture.
- You did very well. Now, put all of the things back into the envelope. Place the envelope on the floor under your chair.

i

- Jook at this group of animals. What are the animals in this group? That's right. There is a dog, a cat and a bird in this group. Why have we placed these animals together in a group? How are these animals alike? Do they all have four legs? No, because the bird does not have four legs. So, the number of legs they have does not make them alike. Could each of these animals be kept as a pet? Let's check each one and see.
- Here is the dog. Could a dog be kept as a pet? If you said yes, you were right. A dog can be kept as a pet.
- What about a cat? Could a cat be kept as a pet? Again if you said yes, you were right. A cat can be kept as a pet.
- Think about this bird. Could a bird like this be kept as a pet? Yes, we could keep a bird like this as a pet.
- 9 Are all of the animals in this set pets? Is the dog a pet? Is the cat a pet? Is the bird a pet? Is that a good reason for putting all of these animals together in a group?
- Here is a group you often see. What are the members of this group? Why are the boys members of this group? Why are the girls members of this group? Are the boys children? Are the girls children? Do we put these girls and boys together in a group because they are all children?
- Now, I have a puzzle for you to solve. Find the envelope beside your desk with the numeral "2" on it. Open it and put all the things on your desk. Find all of the members of the set of 6 animals and place them on the yellow piece of paper. Find all of the members of the set of 3 puppets and place them on the blue sheet of paper. Be careful. There are some things that do not belong in either set. Place the things that do not belong in either set back in the envelope.
- 108 Check your work. Does the work on your desk look like what is in the picture? If it does not look the same, change it so that it matches the picture.
- You did very well. Put the things back into the envelope. Place the envelope on the floor under your chair.
- Look at the members of this group. What are they? Why do we put these books together in a group? Are the books all the same color? No, they aren't the same color. So, that isn't the reason they are placed in a group.
- Is the red book one of the members of the group? How is the red book similar to the other books?

ii

- Is the green book similar to the other objects on the table?
- Let's take a close look. Do you see the red book? Do you see the green book? How are all these things on the table top similar?
- Is this baby similar to the books on the table? Is this baby a member of the set of books. If you said no, you were right. The baby cannot be a member of the set of books because the baby is not a book.
- What do we have here in this group? How are all the balls similar? It's not the colors that make them alike. What is it that makes them alike?
- Is this ball one of the balls in the group of balls? Why can we say this ball can be placed with the other balls?
- Now, find envelope number 3 beside your desk. Make three sets from the things you find in the envelope. Place the members of each of the three sets on a different piece of paper.
- 110 Check your work. Are these the sets you found? There is one set of 3 cars, one set of 3 dolls, and one set of 3 blocks.
- Fine, you are getting the idea. Now, put the things back in the envelope. Place the envelope on the floor under your chair.
- Here are many golf clubs. How are they similar? Why do you think we can place them all in one group? There are two types of golf clubs aren't there? Couldn't we place all the golf clubs made of wood together? Couldn't we place all the golf clubs made of iron together? Yes, we can also put all the golf clubs together but why can we put them together?
- What are some of the foods you see here? How are these food items alike? Are all of these food items, fruit?
- 17 Is the apple a fruit? Is it one of the foods in the original group of food?
- 18 Is the orange similar to the other foods in the group of foods? Is the orange a fruit?
- Is the banana similar to the other foods from the group of foods? Is the banana a fruit?
- 20 How about grapes? Is a grape a fruit? Is this food like the others in the group?

iii

- Let's think for a moment. Here are all the foods. How are they alike? Is each food a fruit?
- Find envelope number 4 beside your desk. Open the envelope. Put the three sheets of paper on your desk. There is one blue sheet, one red sheet and one yellow sheet. Place the set of buttons on the blue sheet. Place the set of candles on the yellow sheet. Place the set of rocks on the red sheet.
- 112 Check your work. Did you do it correctly? If you did not, change yours to look the same as the picture.
- You did very well. Now, put the papers and sets back in the envelope. Place the envelope on the floor under your chair.
- Here's a fellow carrying something. What is he carrying? How are all of these objects alike? It isn't the color because all of the objects are a different color. What is the reason for putting all of these objects together in a group? Is the reason for putting these objects together in a group the fact that all of the members of the group are balloons? Let's check. Is the red object a balloon? Is the yellow object a balloon? What about the green object? Is the green object also a balloon?
- Have you seen these before? Perhaps you have sometimes been sent to the store to buy some things for your mother. If you were, you probably had a set of coins in your pocket. Are all of the objects in this set coins? Let's check and see if the reason these objects are placed together in a group is the fact that they are all coins.
- 39 Is the nickel a coin? Is it similar to the other members of the group.
- Is the dime a coin? Is it similar to the other coins? What, then, is the reason for placing all of these objects together in a group?
- Find the envelope with the numeral five on it. Take the objects out and place them on your desk. There are two sheets of paper. One is green the other is red. Find all of the members of the set of spoons and place them on the red paper. Find all of the members of the set of sticks and place them on the green paper. Be careful. Some of the objects belong to neither set. Place these objects back in the envelope.
- 114 Check your work. Were you correct? Make your work look the same as the picture.

116

- Good. You are learning very fast. Put the objects back in the envelope. Place the envelope on the floor under your chair.
- 737 This is a set of horses.
- Is this cat a member of the set of horses? If you said no, you were right. A cat is not a horse. A cat cannot be a member of the set of horses.
- 43 Here's another group of objects. What are they?
- 53 If you had these pencils, you could draw and draw and draw.
- How are all these pencils similar? We can see that the colors of the pencils are all different, so that can't be a reason. Why, then, can we group these pencils together?
- What color pencil do we have here? Is it one of the pencils we saw in the group of pencils?
- Find envelope number 6 on the floor beside your desk. Open it. Place the three sheets of paper on your desk. Make three sets from the objects you find in the envelope. Put the members of each of the three sets on separate pieces of paper.
- 116 Are these the sets you found? There is a set of fruit. There is a set of jacks. There is a set of crayons.
- You are doing very well. Keep up the good work. Put all of the things on your desk into the envelope. Place the envelope on the floor under your chair.
- Today we have talked about groups of things. We found out that similar things, or objects that are alike can be grouped together only if they have something in common. For example, we talked about the set of balloons. All the members belonged to the set because they were balloons. An airplane is not a balloon, so we couldn't place it in the same set. Can you think of a set? I'll see you tomorrow when we'll do some more exploring in Mr. Mathematics' basket of sets. Good-bye for now.

LESSON ONE: INDUCTIVE-VARIED NON-MANIPULATIVE INTRODUCTION TO SETS

- Hello! I want you to meet Mr. Mathematics. He's going to help me show you some things about mathematics which you may not have learned before. As you can see, he has three baskets of mathematics: numbers, shapes, and sets. In Mr. Mathematics' first basket are numbers. You probably know about this kind of mathematics. Sometimes we call this kind arithemetic. There are two other kinds of mathematics you may not know about. In Mr. Mathematics' second basket are shapes. In Mr. Mathematics' third basket are sets. We'll be exploring the mathematics in each of Mr. Mathematics' baskets. We'll be studying numbers, shapes, and sets. Today we are going to talk about things you often see grouped together. Let's find out why we group some things together.
- We often see dishes on a breakfast table. Are these dishes alike in any way? We can see that all the dishes are the same color, but is color the best reason for putting them together in a group? Are the bowls, dishes? Are the cups, dishes? Are the plates, dishes? What is the best reason for putting the plates, the cups and the bowls together in a group?
- You may have seen these before on the playground. What are they? Why do we place the two swings together? Do we use the two swings for the same purpose?
- 7 Here is one of the swings. How do we use this swing? Do we swing in the swing?
- 6 Here is the group of swings. Do we use both swings for the same purpose?
- Beside your desk is a large envelope with the numeral one on it. Open the envelope. Take out the piece of paper and crayons. Color the members of the set of dishes red. Color the members of the set of blocks green. Color the members of the set of money yellow.
- 107 Check your work. Do your three sets look the same as the three sets in the picture. If your sets are not like the sets in the picture, change them to match the sets in the picture.
- You did very well, Put all of the things back into the envelope. Place the envelope on the floor under your chair.

- Look at this group of animals. What are the animals in this group? That's right. There is a dog, a cat and a bird in this group. Why have we placed these animals together in a group? How are these animals alike? Do they all have four legs? No, because the bird does not have four legs. So, the number of legs they have does not make them alike. Could each of these animals be kept as a pet? Let's check each one and see.
- 10 Here is the dog. Could a dog be kept as a pet? If you said yes, you were right. A dog can be kept as a pet.
- 11 What about a cat? Could a cat be kept as a pet? Again if you said yes, you were right. A cat can be kept as a pet.
- 12 Think about this bird. Could a bird like this be kept as a pet? Yes, we could keep a bird like this as a pet.
- Are all of the animals in this set pets? Is the dog a pet? Is the cat a pet? Is the bird a pet? Is that a good reason for putting all of these animals together in a group?
- Here is a group you often see. What are the members of this group? Why are the boys members of this group? Why are the girls members of this group? Are the boys children? Are the girls children? Do we put these girls and boys together in a group because they are all children?
- Now, I have a puzzle for you to solve. Find the envelope beside your desk with the numeral "2" on it. Open it and put all of the things on your desk. One piece of paper has pictures of many different things. Pick out all of the members of the set of animals and color them yellow. Pick out all of the members of the set of puppets and color them blue. Do not color the things on the paper that do not belong to either set.
- 109 Check your work. Does the work you have completed on your desk look the same as the picture. If it does not, change your work so that they match.
- You did very well. Put the things back into the envelope. Place the envelope on the floor under your chair.
- 33 Look at the members of this group. What are they? Why do we put these books together in a group? Are the books all the same color? No, they aren't the same color. So, that isn't the reason they are placed in a group.
- Is the red book one of the members of the group? How is the red book similar to the other books?

- Is the green book similar to the other objects on the table?
- Let's take a close look. Do you see the red book? Do you see the green book? How are all these things on the table top similar?
- Is this baby similar to the books on the table? Is this baby a member of the set of books. If you said no, you were right. The baby cannot be a member of the set of books because the baby is not a book.
- What do we have here in this group? How are all the balls similar? It's not the colors that make them alike. What is it that makes them alike?
- Is this ball one of the balls in the group of balls? Why can we say that this ball can be placed with the other balls?
- Now, find envelope number 3 beside your desk. Make three sets. Put an "X" on the members of one set. Put an "A" on the members of one set. Put an "O" on the members of one set.
- Did you find sets like these? There is one set of 3 cars, one set of 3 dolls, and one set of 3 blocks.
- Fine, you are getting the idea. Now, put the things back in the envelope. Place the envelope on the floor under your chair.
- Here are many golf clubs. How are they similar? Why do you think we can place them all in one group? There are two types of golf clubs aren't there? Couldn't we place all the golf clubs made of wood together? Couldn't we place all the golf clubs made of iron together? Yes, we can also put all the golf clubs together but why can we put them together?
- 16 What are some of the foods you see here? Are all of these food items fruit? How are these food items alike?
- 17 Is the apple a fruit? Is it one of the foods in the original group of food?
- 18 Is the orange similar to the other foods in the group of foods? Is the orange a fruit?
- Is the banana similar to the other foods from the group

- 20 How about grapes? Is a grape a fruit? Is this food like the others in the group?
- Let's think for a moment. Here are all the foods. How are they alike? Is each food a fruit?
- Find envelope number 4 beside your desk. Open the envelope. Find the paper and three crayons and place them on your desk. There is one red crayon, one yellow crayon, and one blue crayon. Color the members of the set of buttons, red. Color the members of the set of candles, yellow. Color the members of the set of rocks, blue.
- 113 Check your work. Did you do it correctly? If you did not, change it so that it is correct. Make yours look the same as the picture.
- You did very well. Now, put the crayons and paper back into the envelope. Place the envelope on the floor under your chair.
- Here's a fellow carrying something. What is he carrying? How are all of these objects alike? It isn't the color because all of the objects are a different color. What is the reason for putting all of these objects together in a group? Is the reason for putting these objects together in a group the fact that all of the members of the group are balloons? Let's check. Is the red object a balloon? Is the yellow object a balloon? What about the green object? Is the green object also a balloon?
- Have you seen these before? Perhaps you have sometimes been sent to the store to buy some things for your mother. If you were, you probably had a set of coins in your pocket. Are all of the objects in this set coins? Let's check and see if the reason these objects are placed together in a group is the fact that they are all coins.
- Is the nickel a coin? Is it similar to the other members of the group?
- 40 Is the dime a coin? Is it similar to the other coins? What, then, is the reason for placing all of these objects together in a group?
- Find the envelope on the floor with the number 5 on it. Take the paper and crayons out and place them on your desk. Look at the pictures on the paper. Find all of the members of the set of spoons and color them red. Find all of the members of the set of sticks and color them green. Be careful. Some of the objects do not beolng to either set. Do not color these objects.

iv

- 115 Check your work. Did you do it correctly? If your work does not match the picture, change it so that it does.
- 53 Good. You are learning very fast. Put your paper and crayons back in the envelope. Place the envelope on the floor under your chair.
- 737 This is a set of horses.
- Is this cat a member of the set of horses? If you said no, you were right. A cat is not a horse. A cat cannot be a member of the set of horses.
- 43 Here's another group of objects. What are they?
- If you had these pencils, you could draw and draw and draw.
- How are all these pencils similar? We can see that the colors of the pencils are all different, so that can't be a reason. Why, then, can we group these pencils together?
- What color pencil do we have here? Is it one of the pencils we saw in the group of pencils?
- Find the envelope with the number 6 on it on the floor beside your desk. Open it. Place the paper and pencil on your desk. Find three sets. Put "A's" on the members of one set. Put "X's" on the members of one set. Put "0's" on the members of one set.
- Did you find these sets? There is a set of jacks. There is a set of crayons. There is a set of fruit.
- You are doing very well. Keep up the good work. Put all of the things on your desk back into the envelope. Place the envelope on the floor under your chair.
- Today we have talked about groups of things. We found out that similar things, or objects that are alike can be grouped together only if they have something in common. For example, we talked about the set of balloons. All the members belonged to the set because they were balloons. An airplane is not a balloon, so we couldn't place it in the same set. Can you think of a set? I'll see you tomorrow when we'll do some more exploring in Mr. Mathematics' basket of sets. Good-bye for now.

LESSON ONE: INDUCTIVE-EXACT MANIPULATIVE INTRODUCTION TO SETS

- Hello! I want you to meet Mr. Mathematics. He's going to help me show you some things about mathematics which you may not have learned before. As you can see, he has three baskets of mathematics: numbers, shapes, and sets. In Mr. Mathematics' first basket are numbers. You probably know about this kind of mathematics. Sometimes we call this kind arithmetic. There are two other kinds of mathematics you may not know about. In Mr. Mathematics' second basket are shapes. In Mr. Mathematics' third basket are sets. We'll be studying numbers, shapes, and sets. Today we are going to talk about things you often see grouped together. Let's find out why we group some things together.
- We often see dishes on a breakfast table. Are these dishes alike in any way? We can see that all the dishes are the same color, but is color the best reason for putting them together in a group? Are the bowls, dishes? Are the cups, dishes? Are the plates, dishes? What is the best reason for putting the plates, the cups and the bowls together in a group?
- You may have seen these before on the playground. What are they? Why do we place the two swings together? Do we use the two swings for the same purpose?
- 7 Here is one of the swings. How do we use this swing? Do we swing in the swing?
- 6 Here is the group of swings. Do we use <u>both</u> swings for the same purpose?
- Beside your desk is a large envelope with the numeral one on it. Open the envelope. Put the three sheets of paper on your desk. There is one green sheet, one red sheet and one yellow sheet. Place the set of blocks on the green sheet. Place the set of dishes on the red sheet. Place the set of money on the yellow sheet.
- 106 Check your work. Do the three sets of yours look the same as the three sets in the picture. If your sets are not like the sets in the picture, change them to match the sets in the picture.
- You did very well. Now, put all of the things back into the envelope. Place the envelope on the floor under your chair.

- Do Look at this group of animals. What are the animals in this group? That's right. There is a dog, a cat and a bird in this group. Why have we placed these animals together in a group? How are these animals alike? Do they all have four legs? No, because the bird does not have four legs. So, the number of legs they have does not make them alike. Could each of these animals be kept as a pet. Let's check each one and see.
- 10 Here is the dog. Could a dog be kept as a pet? If you said yes, you were right. A dog can be kept as a pet.
- Il What about a cat? Could a cat be kept as a pet? Again if you said yes, you were right. A cat can be kept as a pet.
- Think about this bird. Could a bird like this be kept as a pet? Yes, we could keep a bird like this as a pet.
- Are all of the animals in this set pets? Is the dog a pet? Is the cat a pet? Is the bird a pet? Is that a good reason for putting all of these animals together in a group?
- Here is a group you often see. What are the members of this group? Why are the boys members of this group? Why are the girls members of this group? Are the boys children? Are the girls children? Do we put these girls and boys together in a group because they are all children?
- Now, I have a puzzle for you to solve. Find the envelope beside your desk with the numeral "2" on it. Open it and put all the things on your desk. Find all of the members of the set of 6 animals and place them on the yellow piece of paper. Find all of the members of the set of 3 puppets and place them on the blue sheet of paper. Be careful. There are some things that do not belong in either set. Place the things that do not belong in either set back in the envelope.
- 108 Check your work. Does the work on your desk look like what is in the picture? If it does not look the same, change it so that it matches the picture.
- You did very well. Put the things back into the envelope. Place the envelope on the floor under your chair.
- Look at the members of this group. What are they? Why do we put these books together in a group? Are the books all the same color? No, they aren't the same color. So, that isn't the reason they are placed in a group.
- Is the red book one of the members of the group? How is the red book similar to the other books?

ii

- 35 Is the green book similar to the other objects on the table?
- 33 Let's take a close look. Do you see the red book? Do you see the green book? How are all these things on the table top similar?
- Is this baby similar to the books on the table? Is this baby a member of the set of books. If you said no, you were right. The baby cannot be a member of the set of books because the baby is not a book.
- What do we have here in this group? How are all the balls similar? It's not the colors that make them alike. What is it that makes them alike?
- Is this ball one of the balls in the group of balls? Why can we say that this ball can be placed with the other balls?
- Now, find envelope number 3 beside your desk. Make three sets from the things you find in the envelope. Place the members of each of the three sets on a different piece of paper.
- 110 Check your work. Are these the sets you found? There is one set of 3 cars, one set of 3 dolls, and one set of 3 blocks.
- Fine, you are getting the idea. Now, put the things back in the envelope. Place the envelope on the floor under the chair.
- We often see dishes on a breakfast table. Are these dishes alike in any way? We can see that all the dishes are the same color, but is color the best reason for putting them together in a group? Are the bowls, dishes? Are the cups, dishes? Are the plates, dishes? What is the best reason for putting the plates, the cups and the bowls together in a group?
- You may have seen these before on the playground. What are they? Why do we place the two swings together? Do we use the two swings for the same purpose?
- Here is one of the swings. How do we use this swing? Do we swing in the swing?
- 6 Here is the group of swings. Do we use <u>both</u> swings for the same purpose?
- Beside your desk is a large envelope with the numeral one on it. Open the envelope. Put the three sheets of paper on your desk. There is one green sheet, one red sheet and one yellow sheet. Place the set of blocks on the green sheet. Place the set of dishes on the red sheet. Place the set of money on the yellow sheet.

- 106 Check your work. Do the three sets of yours look the same as the three sets in the picture. If your sets are not like the sets in the picture, change them to match the sets in the picture.
- You did very well. Now, put all of the things back into the envelope. Place the envelope on the floor under your chair.
- Look at this group of animals. What are the animals in this group? That's right. There is a dog, a cat and a bird in this group. Why have we placed these animals together in a group? How are these animals alike? Do they all have four legs? No, because the bird does not have four legs. So, the number of legs they have does not make them alike. Could each of these animals be kept as a pet? Let's check each one and see.

- Now, I have a puzzle for you to solve. Find the envelope beside your desk with the numeral "2" on it. Open it and put all the things on your desk. Find all of the members of the set of 6 animals and place them on the yellow piece of paper. Find all of the members of the set of 3 puppets and place them on the blue sheet of paper. Be careful. There are some things that do not belong in either set. Place the things that do not belong in either set back in the envelope.
- 108 Check your work. Does the work on your desk look like what is in the picture? If it does not look the same, change it so that it matches the picture.
- You did very well. Put the things back into the envelope. Place the envelope on the floor under your chair.

- Look at the members of this group. What are they? Why do we put these books together in a group? Are the books all the same color? No, they aren't the same color. So, that isn't the reason they are placed in a group.
- Is the red book one of the members of the group? How is the red book similar to the other books?
- 35 Is the green book similar to the other objects on the table?
- 33 Let's take a close look. Do you see the red book? Do you see the green book? How are all these things on the table top similar?
- Is this baby similar to the books on the table? Is this baby a member of the set of books. If you said no, you were right. The baby cannot be a member of the set of books because the baby is not a book.
- What do we have here in this group? How are all the balls similar? It's not the colors that make them alike. What is it that makes them alike?
- Is this ball one of the balls in the group of balls? Why can we say that this ball can be placed with the other balls?
- Now, find envelope number 3 beside your desk. Make three sets from the things you find in the envelope. Place the members of each of the three sets on a different piece of paper.
- 110 Check your work. Are these the sets you found? There is one set of 3 cars, one set of 3 dolls, and one set of 3 blocks.
- Fine, you are getting the idea. Now, put the things back in the envelope. Place the envelope on the floor under your chair.
- Today we have talked about groups of things. We found out that similar things, or objects that are alike can be grouped together only if they have something in common. For example, we talked about the set of balloons. All the members belonged to the set because they were balloons. An airplane is not a balloon, so we couldn't place it in the same set. Can you think of a set? I'll see you tomorrow when we'll do some more exploring in Mr. Mathematics' basket of sets. Good-bye for now.

LESSON ONE: INDUCTIVE-EXACT NON-MANIPULATIVE INTRODUCTION TO SETS

- Hello! I want you to meet Mr. Mathematics. He's going to help me show you some things about mathematics which you may not have learned before. As you can see, he has three baskets of mathematics: numbers, shapes, and sets. In Mr. Mathematics' first basket are numbers. You probably know about this kind of mathematics. Sometimes we call this kind arithmetic. There are two other kinds of mathematics you may not know about. In Mr. Mathematics' second basket are shapes. In Mr. Mathematics' third basket are sets. We'll be exploring the mathematics in each of Mr. Mathematics' baskets. We'll be studying numbers, shapes, and sets. Today we are going to talk about things you often see grouped together. Let's find out why we group some things together.
- We often see dishes on a breakfast table. Are these dishes alike in any way? We can see that all the dishes are the same color, but is the color the best reason for putting them together in a group? Are the bowls, dishes? Are the cups, dishes? Are the plates, dishes? What is the best reason for putting the plates, the cups and the bowls together in a group?
- You may have seen these before on the playground. What are they? Why do we place the two swings together? Do we use the two swings for the same purpose?
- 7 Here is one of the swings. How do we use this swing? Do we swing in the swing?
- 6 Here is the group of swings. Do we use both swings for the same purpose?
- Beside your desk is a large envelope with the numeral one on it. Open the envelope. Take out the piece of paper and crayons. Color the members of the set of dishes red. Color the members of the set of blocks green. Color the members of the set of money yellow.
- 107 Check your work. Do your three sets look the same as the three sets in the picture. If your sets are not like the sets in the picture, change them to match the sets in the picture.
- You did very well. Put all of the things back into the envelope. Place the envelope on the floor under your chair.

- 9 Look at this group of animals. What are the animals in this group? That's right. There is a dog, a cat and a bird in this group. Why have we placed these animals together in a group? How are these animals alike? Do they all have four legs? No, because the bird does not have four legs. So, the number of legs they have does not make them alike. Could each of these animals be kept as a pet? Let's check each one and see.
- Here is the dog. Could a dog be kept as a pet? If you said yes, you were right. A dog can be kept as a pet.
- 11 What about a cat? Could a cat be kept as a pet? Again if you said yes, you were right. A cat can be kept as a pet.
- Think about this bird. Could a bird like this be kept as a pet? Yes, we could keep a bird like this as a pet.
- Are all of the animals in this set pets? Is the dog a pet? Is the cat a pet? Is the bird a pet? Is that a good reason for putting all of these animals together in a group?
- Here is a group you often see. What are the members of this group? Why are the boys members of this group? Why are the girls members of this group? Are the boys children? Are the girls children? Do we put these girls and boys together in a group because they are all children?
- Now, I have a puzzle for you to solve. Find the envelope beside your desk with the numeral 2 on it. Open it and put all of the things on your desk. One piece of paper has pictures of many different things. Pick out all of the members of the set of animals and color them yellow. Pick out all of the members of the set of puppets and color them blue. Do not color the things on the paper that do not belong to either set.
- 109 Check your work. Does the work you have completed on your desk look the same as the picture. If it does not, change your work so that they match.
- You did very well. Put the things back into the envelope. Place the envelope on the floor under your chair.
- Look at the members of this group. What are they? Why do we put these books together in a group? Are the books all the same color? No, they aren't the same color. So, that isn't the reason they are placed in a group.

- Is the red book one of the members of the group? How is the red book similar to the other books?
- Is the green book similar to the other objects on the table?
- 33 Let's take a close look. Do you see the red book? Do you see the green book? How are all these things on the table top similar?
- Is this baby similar to the books on the table? Is this baby a member of the set of books. If you said no, you were right. The baby cannot be a member of the set of books because the baby is not a book.
- What do we have here in this group? How are all the balls similar? It's not the colors that make them alike. What is it that makes them alike?
- Is this ball one of the balls in the group of balls?
 Why can we say that this ball can be placed with the other balls?
- Now, find envelope number 3 beside your desk. Make three sets. Put an "X" on the members of one set. Put an "A" on the members of one set. Put an "0" on the members of one set.
- Did you find sets like these? There is one set of 3 cars, one set of 3 dolls, and one set of 3 blocks.
- 53 Fine, you are getting the idea. Now, put the things back in the envelope. Place the envelope on the floor under your chair.
- We often see dishes on a breakfast table. Are these dishes alike in any way? We can see that all the dishes are the same color, but is color the best reason for putting them together in a group? Are the bowls, dishes? Are the cups, dishes? Are the plates, dishes? What is the best reason for putting the plates, the cups and the bowls together in a group?
- You may have seen these before on the playground. What are they? Why do we place the two swings together? Do we use the two swings for the same purpose?
- 7 Here is one of the swings. How do we use this swing? Do we swing in the swing?
- 6 Here is the group of swings. Do we use both swings for the same purpose?

- Beside your desk is a large envelope with the numeral one on it. Open the envelope. Take out the piece of paper and crayons. Color the members of the set of dishes red. Color the members of the set of blocks green. Color the members of the set of money yellow.
- 107 Check your work. Do your three sets look the same as the three sets in the picture. If your sets are not like the sets in the picture, change them to match the sets in the picture.
- You did very well. Put all of the things back into the envelope. Place the envelope on the floor under your chair.
- Look at this group of animals. What are the animals in this group? That's right. There is a dog, a cat and a bird in this group. Why have we placed these animals together in a group? How are these animals alike? Do they all have four legs? No, because the bird does not have four legs. So, the number of legs they have does not make them alike. Could each of these animals be kept as a pet? Let's check each one and see.
- Here is the dog. Could a dog be kept as a pet? If you said yes, you were right. A dog can be kept as a pet.
- What about a cat? Could a cat be kept as a pet? Again if you said yes, you were right. A cat can be kept as a pet.
- Think about this bird. Could a bird like this be kept as a pet? Yes, we could keep a bird like this as a pet.
- 9 Are all of the animals in this set pets? Is the dog a pet? Is the cat a pet? Is the bird a pet? Is that a good reason for putting all of these animals together in a group?
- Here is a group you often see. What are the members of this group? Why are the boys members of this group? Why are the girls members of this group? Are the boys children? Are the girls children? Do we put these girls and boys together in a group because they are all children?
- Now, I have a puzzle for you to solve. Find the envelope beside your desk with the numeral "2" on it. Open it and put all of the things on your desk. One piece of paper has pictures of many different things. Pick out all of the members of the set of animals and color them yellow. Pick out all of the members of the set of puppets and color them blue. Do not color the things on the paper that do not belong to either set.

- 109 Check your work. Does the work you have completed on your desk look the same as the picture. If it does not, change your work so that they match.
- You did very well. Put the things back into the envelope. Place the envelope on the floor under your chair.
- 33 Look at the members of this group. What are they? Why do we put these books together in a group? Are the books all the same color? No, they aren't the same color. So, that isn't the reason they are placed in a group.
- Is the red book one of the members of the group? How is the red book similar to the other books?
- 35 Is the green book similar to the other objects on the table?
- 33 Let's take a close look. Do you see the red book? Do you see the green book? How are all these things on the table top similar?
- Is this baby similar to the books on the table? Is this baby a member of the set of books. If you said no, you were right. The baby cannot be a member of the set of books because the baby is not a book.
- What do we have here in this group? How are all the balls similar? It's not the colors that make them alike. What is it that makes them alike?
- Is this ball one of the balls in the group of balls? Why can we say that this ball can be placed with the other balls?
- Now, find envelope number 3 beside your desk. Make three sets. Put an "X" on the members of one set. Put an "A" on the members of one set. Put an "O" on the members or one set.
- Did you find sets like these? There is one set of 3 cars, one set of 3 dolls, and one set of 3 blocks.
- Fine, you are getting the idea. Now, put the things back in the envelope. Place the envelope on the floor under your chair.
- Today we have talked about groups of things. We found out that similar things, or objects that are alike can be grouped together only if they have something in common. For example, we talked about the set of balloons. All the members belonged to the set because they were balloons. An airplane is not a balloon, so we couldn't place it in the same set. Can you think of a set? I'll see you tomorrow when we'll do some more exploring in Mr. Mathematics' basket of sets. Good-bye for now.

LESSON ONE: DEDUCTIVE-VARIED-MANIPULATIVE INTRODUCTION TO SETS

Hello! I want you to meet Mr. Mathematics. He's going to help me show you some things about mathematics which you may not have learned before. As you can see, he has three baskets of mathematics: numbers, shapes, and sets. In Mr. Mathematics' first basket are numbers. You probably know about this kind of mathematics. Sometimes we call this kind, arithmetic. There are two other kinds of mathematics in his basket. In Mr. Mathematics' second basket are shapes. In Mr. Mathematics' third basket are sets. We'll be exploring the mathematics in each of Mr. Mathematics' baskets. We'll be studying numbers, shapes, and sets.

Today we are going to talk about some of the sets which you see every day. But what is a set? A set is a group of things which go together. We call these things in a set, members of the set.

- Here is a set you may have seen on the breakfast table this morning. This is a set of dishes. The things in this set go together because they are all dishes. Every member of this set is a dish. The members of this set are two large plates, two small plates, two bowls and two cups. This is a set of dishes.
- 6 Here is another set you may have seen recently. You may have seen a set like this on the playground. Have you ever swing on a swing? This is a set of swings. Every member of this set is a swing. You can swing on every member of this set.
- 7 This is one member of the set of swings. You can swing on this set member. Every member of this set is a swing. You can swing on every member of this set.
- Beside your desk is a large envelope with the numeral one on it. Open the envelope. Put the three sheets of paper on your desk. There is one green sheet, one red sheet and one yellow sheet. Place the set of blocks on the green sheet. Place the set of dishes on the red sheet. Place the set of money on the yellow sheet.
- 106 Check your work. Do the three sets of yours look the same as the three sets in the picture. If your sets are not like the sets in the picture, change them to match the sets in the picture.
- You did very well. Now, put all of the things back into the envelope. Place the envelope on the floor under your chair.

i

Have you ever had a pet?

54

- This set of pets has in it a dog, a cat, and a bird. The pets in this set are each a different color. The dog is brown. The cat is white and the bird is green. But the reason these animals are members of the set is because they are all pets.
- 10 The dog is a pet. Therefore, he is a member of the set of pets.
- If the cat is also a member of the set because he is a pet.
- The bird is also a member of the set because he is a pet.
- 9 The dog, the cat, and the bird make up the set of pets. Every member of the set of pets is a pet.
- Another set which you see every day is the set of boys. There are sets of boys in your classroom, aren't there? This set of boys has five members. Each boy has a different colored shirt. All of these boys are members of the set. They are all members of this set because they are all boys. A girl could not be a member of this set. Only boys can be members of this set. This is a set of boys.
- Now, I have a puzzle for you to solve. Find the envelope beside your desk with the numeral "2" on it. Open it and put all the things on your desk. Find all of the members of the set of 6 animals and place them on the yellow piece of paper. Find all of the members of the set of 3 puppets and place them on the blue sheet of paper. Be careful. There are some things that do not belong in either set. Place the things that do not belong in either set back in the envelope.
- 108 Check your work. Does the work on your desk look like what is in the picture? If it does not look the same, change it so that it matches the picture.
- You did very well. Put the things back into the envelope. Place the envelope on the floor under your chair.
- You probably saw this set today in your classroom. This is a set of books. Each of these books is a different color, but you can read every member of this set.
- You can read the red book. The red book is a member of the set. Any book could be a member of this set.

ii

- 35 This green book is also a member of the set of books. You can read this green book.
- 33 All of the books on this table are members of the set. This is a set of books.
- This baby would not be a member of the set of books. Only books can be members of this set.
- The set we are going to talk about now is the set of balls. Each ball is a different color. You can bounce every member of this set. You can roll every member of this set, and you can throw every member of this set.
- Here is one member of the set of balls. You can bounce this ball. You can roll this ball and you can throw this ball. This ball is a member of the set of balls.
- Now find envelope number 3 beside your desk. Make three sets from the things you find in the envelope. Place the members of each of the three sets on a different piece of paper.
- 110 Check your work. Are these the sets you found? There is one set of 3 cars, one set of 3 dolls, and one set of 3 blocks.
- Fine, you are getting the idea. Now, put the things back in the envelope. Place the envelope on the floor under your chair.
- Here is a set of golf clubs. Have you ever played golf? I play sometimes. Sometimes I watch other people play golf on television. You could use this set to play golf. The members of this set go together because they are all used to play golf. They are all golf clubs. Some of the members of the set are called irons, because they are made out of iron. Some of the members of this set are called woods, because they are made out of wood. But all of the woods and all of the irons are members of the set because they are all golf clubs. All of these golf clubs together in a group make up the set of golf clubs.
- This set will make you hungry. You may have seen this set at lunch time. This set of fruits has as its members an apple, an orange, a banana, and a bunch of grapes. You can eat every member of this set.
- 17 You can eat an apple. The apple is a member of the set of fruits.
- 18 You can eat an orange. The orange is a member of the set of fruits. 135

- 19 You can eat a banana. The banana is a member of the set of fruits.
- 20 You can eat grapes. This bunch of grapes is also a member of the set of fruits.
- The apple, the orange, the banana, and the bunch of grapes are all members of the set because they are all pieces of fruit.
- Find envelope number 4 beside your desk. Open the envelope. Put the three sheets of paper on your desk. There is one blue sheet, one red sheet and one yellow sheet. Place the set of buttons on the blue sheet. Place the set of candles on the yellow sheet. Place the set of rocks on the red sheet.
- 112 Check your work. Did you do it correctly? If you did not, change yours to look the same as the picture.
- You did very well. Now, put the papers and sets back in the envelope. Place the envelope on the floor under your chair.
- Now you are looking at a set of balloons. All of the balloons together in a group make up the set of balloons. Have you ever had a balloon? This boy has lots of balloons. Each balloon that he is holding is a member of the set. All of the balloons make up his set of balloons.
- This time the things we are going to talk about are coins. Have you ever been sent to the store to do some shopping? If you did, you probably had a set of coins in your pocket. The coins in this set are a fifty-cent piece, a quarter or a twenty-five cent piece, two dimes, a nickel, and three pennies. Each coin is one member of the set. Every member of the set is a coin. All of the coins together in a group make up the set of coins. You can see the different members of this set.
- 39 Here is a nickel. The nickel is a coin. Therefore, the nickel is a member of the set of coins.
- Here is a dime. The dime is also a coin. Therefore, the dime is a member of the set of coins.
- Find the envelope with the numeral five on it. Take the objects out and place them on your desk. There are two sheets of paper. One is green the other is red. Find all of the members of the set of spoons and place them on the red paper. Find all of the members of the set of sticks and place them on the green paper. Be careful. Some of the objects belong to neither set. Place these objects back in the envelope.

iv

- 114 Check your work. Were you correct? Make your work look the same as the picture.
- Good. You are learning very fast. Put the objects back in the envelope. Place the envelope on the floor under your chair.
- 737 This is a set of horses.
- Is this cat a member of the set of horses?
- Here is a set of pretty colored pencils. If you had these pencils you could draw and draw and draw. Every member of this set is a different color. Every member of this set is a pencil. Each pencil is one member of the set.
- Here is one member of the set of pencils. There are lots of other members in the set of pencils. Can you think of one? Remember, all of the members of this set are pencils. Would a pen be a member of the set of pencils? Think about it.
- Find envelope number 6 on the floor beside your desk.

 Open it. Place the three sheets of paper on your desk. Make three sets from the objects you find in the envelope. Put the members of each of the three sets on separate pieces of paper.
- Are these the sets you found? There is a set of fruits. There is a set of jacks. There is a set of crayons.
- You are doing very well. Keep up the good work. Put all of the things on your desk into the envelope. Place the envelope on the floor under your chair.
- Good-bye for now. I'll see you tomorrow and we'll do some more exploring in the basket of sets.

LESSON ONE: DEDUCTIVE VARIED NON-MANIPULATIVE INTRODUCTION TO SETS

Hello! I want you to meet Mr. Mathematics. He's going to help me show you some things about mathematics which you may not have learned before. As you can see, he has three baskets of mathematics: numbers, shapes, and sets. In Mr. Mathematics' first basket are numbers. You probably know about this kind of mathematics. Sometimes we call this kind, arithmetic. There are two other kinds of mathematics in his basket. In Mr. Mathematic's second basket are shapes. In Mr. Mathematic's third basket are sets. We'll be exploring the mathematics in each of Mr. Mathematics' baskets. We'll be studying numbers, shapes and sets.

Today we are going to talk about some of the sets which you see every day. But what is a set? A set is a group of things which go together. We call these things in a set, members of the set.

- Here is a set you may have seen on the breakfast table this morning. This is a set of dishes. The things in this set go together because they are all dishes. Every member of this set is a dish. The members of this set are two large plates, two small plates, two bowls and two cups. This is a set of dishes.
- 6. Here is another set you may have seen recently. You may have seen a set like this on the playground. Have you ever swung on a swing? This is a set of swings. Every member of this set is a swing. You can swing on every member of this set.
- 7 This is one member of the set of swings. You can swing on this set member. Every member of this set is a swing. You can swing on every member of this set.
- Beside your desk is a large envelope with the numeral one on it. Open the envelope. Take out the piece of paper and crayons. Color the members of the set of dishes red. Color the members of the set of blocks green. Color the members of the set of money yellow.
- 107 Check your work. Do your three sets look the same as the three sets in the picture. If your sets are not like the sets in the picture, change them to match the sets in the picture.
- You did very well. Put all of the things back into the envelope. Place the envelope on the floor under your chair.
- 54 Have you ever had a pet?

i

- This set of pets has in it a dog, a cat, and a bird. The pets in this set are each a different color. The dog is brown. The cat is white and the bird is green. But the reason these animals are members of the set is because they are all pets.
- The dog is a pet. Therefore, he is a member of the set of pets.
- The cat is also a member of the set because he is a pet.
- The bird is also a member of the set because he is a pet.
- ? The dog, the cat, and the bird make up the set of pets.*
 Every member of the set of pets is a pet.
- Another set which you see every day is the set of boys. There are sets of boys in your classroom, aren't there? This set of boys has five members of the set. They are all members of this set because they are all boys. A girl could not be a member of this set. Only boys can be members of this set. This is a set of boys.
- Now, I have a puzzle for you to solve. Find the envelope beside your desk with the number "2" on it. Open it and put all of the things on your desk. One piece of paper has pictures of many different things. Pick out all of the members of the set of animals and color them yellow. Pick out all of the members of the set of puppets and color them blue. Do not color the things on the paper that do not belong to either set.
- 109 Check your work. Does the work you have completed on your desk look the same as the picture. If it does not, change your work so that they match.
- You did very well. Put the things back into the envelope. Place the envelope on the floor under your chair.
- 33 You probably saw this set today in your classroom. This is a set of books. Each of these books is a different color, but you can read every member of this set.
- You can read the red took. The red book is a member of the set. Any book could be a member of this set.
- This green book is also a member of the set of books. You can read this green book.
- 33 All of the books on this table are members of the set. This is a set of books. 139

- This baby would not be a member of the set of books. Only books can be members of this set.
- The set we are going to talk about now is the set of balls Each ball is a different color. You can bounce every member of this set. You can roll every member of this set, and you can throw every member of this set.
- Here is one member of the set of balls. You can bounce this ball. You can roll this ball and you can throw this ball. This ball is a member of the set of balls.
- Now, find envelope number 3 beside your desk. Make three sets. Put an "X" on the members of one set. Put an "A" on the members of one set. Put an "O" on the members of one set.
- Did you find sets like these? There is one set of 3 cars, one set of 3 dolls, and one set of 3 blocks.
- 53 Fine, you are getting the idea. Now, put the things back in the envelope. Place the envelope on the floor under your chair.
- Here is a set of golf clubs. Have you ever played golf? I play sometimes. Sometimes I watch other people play golf on television. You could use this set to play golf. The members of this set go together because they are all used to play golf. They are all golf clubs. Some of the members of the set are called irons, because they are made out of iron. Some of the members of this set are called woods, because they are made out of wood. But all of the woods and all of the irons are members of the set because they are all golf clubs. All of these golf clubs together in a group make up the set of golf clubs.
- This set will make you hungry. You may have seen this set at lunch time. This set of fruits has as its members an apple, an orange, a banana and a bunch of grapes. You can eat every member of this set.
- 17 You can eat an apple. The apple is a member of the set of fruits.
- 18 You can eat an orange. The orange is a member of the set of fruits.
- 19 You can eat a banana. The banana is a member of the set of fruits.
- You can eat grapes. This bunch of grapes is also a member of the set of fruits.

111

- The apple, the orange, the banana, and the bunch of grapes are all members of the set because they are all pieces of fruit.
- Find envelope number 4 beside your desk. Open the envelope. Find the paper and three crayons and place them on your desk. There is one red crayon, one yellow crayon and one blue crayon. Color the members of the set of buttons, red. Color the members of the set of candles, yellow. Color the members of the set of rocks, blue.
- 113 Check your work. Did you do it correctly? If you did not, change it so that it is correct. Make yours look the same as the pictures.
- You did very well. Now, put the crayons and paper back into the envelope. Place the envelope on the floor under your chair.
- Now you are looking at a set of balloons. All of the balloons together in a group make up the set of balloons. Have you ever had a balloon? This boy has lots of balloons. Each balloon that he is holding is a member of the set. All of the balloons make up his set of balloons.
- This time the things we are going to talk about are coins. Have you ever been sent to the store to do some shopping? If you did, you probably had a set of coins in your pocket. The coins in this set are a fifty-cent piece, a quarter or a twenty-five cent piece, two dimes, a nickel, and three pennies. Each coin is one member of the set. Every member of the set is a coin. All of the coins together in a group make up the set of coins. You can see the different members of this set.
- 39 Here is a nickel. The nickel is a coin. Therefore, the nickel is a member of the set of coins.
- Here is a dime. The dime is also a coin. Therefore, the dime is a member of the set of coins.
- Find the envelope on the floor with the numeral 5 on it. Take the paper and crayons out and place them on your desk. Look at the pictures on the paper. Find all of the members of the set of spoons and color them red. Find all of the members of the set of sticks and color them green. Be careful. Some of the objects do not belong to either set. Do not color these objects.
- 115 Check your work. Did you do it correctly? If your work does not match the picture, change it so that it does.
- 53 Good. You are learning very fast. Put your paper and crayons back in the envelope. Place the envelope on the floor under your chair.

iv

- 737 This is a set of horses.
- Is this cat a member of the set of horses?
- Here is a set of pretty colored pencils. If you had these pencils you could draw and draw and draw. Every member of this set is a different color. Every member of this set is a pencil. Each pencil is one member of the set.
- Here is one member of the set of pencils. There are lots of other members in the set of pencils. Can you think of one? Remember, all of the members of this set are pencils. Would a pen be a member of the set of pencils? Think about it.
- Find the envelope with the number 6 on it on the floor beside your desk. Open it. Place the paper and pencil on your desk. Find three sets. Put A's on the members of one set. Put X's on the members of one set.
- Did you find these sets? There is a set of jacks. There is a set of crayons. There is a set of fruit.
- You are doing very well. Keep up the good work. Put all of the things on your desk back into the envelope. Place the envelope on the floor under your chair.
- I Good-bye for now. I'll see you tomorrow and we'll do some more exploring in the basket of sets.

LESSON ONE: DEDUCTIVE-EXACT MANIPULATIVE INTRODUCTION TO SETS

Hello! I want you to meet Mr. Mathematics'. He's going to help me show you some things about mathematics which you may not have learned before. As you can see, he has three baskets of mathematics: numbers, shapes, and sets. In Mr. Mathematics' first basket are numbers. You probably know about this kind of mathematics. Sometimes we call this kind, arithmetic. There are two other kinds of mathematics in his basket. In Mr. Mathematics' second basket are shapes. In Mr. Mathematics' third basket are sets. We'll be exploring the mathematics in each of Mr. Mathematics' baskets. We'll be studying numbers, shapes and sets.

Today we are going to talk about some of the sets which you see every day. But what is a set? A set is a group of things which go together. We call these things in a set, members of the set.

- Here is a set you may have seen on the breakfast table this morning. This is a set of dishes. The things in this set go together because they are all dishes. Every member of this set is a dish. The members of this set are two large plates, two small plates, two bowls and two cups. This is a set of dishes.
- Here is another set you may have seen recently. You may have seen a set like this on the playground. Have you ever swung on a swing? This is a set of swings. Every member of this set is a swing. You can swing on every member of this set.
- 7 This is one member of the set of swings. You can swing on this set member. Every member of this set is a swing. You can swing on every member of this set.
- Beside your desk is a large envelope with the numeral one on it. Open the envelope. Put the three sheets of paper on your desk. There is one green sheet, one red sheet and one yellow sheet. Place the set of blocks on the green sheet. Place the set of dishes on the red sheet. Place the set of money on the yellow sheet.
- 106 Check your work. Do the three sets of yours look the same as the three sets in the picture. If your sets are not like the sets in the picture, change them to match the sets in the picture.
- You did very well. Now, put all of the things back into the envelope. Place the envelope on the floor under your chair.

 143

- 54 Have you ever had a pet?
- This set of pets has in it a dog, a cat, and a bird. The pets in this set are each a different color. The dog is brown. The cat is white and the bird is green. But the reason these animals are members of the set is because they are all pets.
- 10 The \log is a pet. Therefore, he is a member of the set of pets.
- Il The cat is also a member of the set because he is a pet.
- The bird is also a member of the set because he is a pet.
- 9 The dog, the cat, and the bird make up the set of pets. Every member of the set of pets is a pet.
- Another set which you see every day is the set of boys. There are sets of boys in your classroom, aren't there? This set of boys has five members. Each boy has a different colored shirt. All of these boys are members of the set. They are all members of this set because they are all boys. A girl could not be a member of this set. Only boys can be members of this set. This is a set of boys.
- Now, I have a puzzle for you to solve. Find the envelope beside your desk with the numeral "2" on it. Open it and put all the things on your desk. Find all of the members of the set of 3 puppets and place them on the blue sheet of paper. Be careful. There are some things that do not belong in either set. Place the things that do not belong in either set back in the envelope.
- 108 Check your work. Does the work on your desk look like what is in the picture? If it does not look the same, change it so that it matches the picture.
- You did very well. Put the things back into the envelope. Place the envelope on the floor under your chair.
- You probably saw this set today in your classroom. This is a set of books. Each of these books is a different color, but you can read every member of this set.
- You can read the red book. The red book is a member of the set. Any book could be a member of this set.
- This green book is also a member of the set of books. You can read this green book. $\frac{1}{4}$

- 33 All of the books on this table are members of the set. This is a set of books.
- This baby would not be a member of the set of books. Only books can be members of this set.
- The set we are going to talk about now is the set of balls. Each ball is a different color. You can bounce every member of this set. You can roll every member of this set, and you can throw every member of this set.
- Here is one member of the set of balls. You can bounce this ball. You can roll this ball and you can throw this ball. This ball is a member of the set of balls.
- Now, find envelope number 3 beside your desk. Make three sets from the things you find in the envelope. Place the members of each of the three sets on a different piece of paper.
- 110 Check your work. Are these the sets you found? There is one set of 3 cars, one set of 3 dolls, and one set of 3 blocks.
- 53 Fine, you are getting the idea. Now, put the things back in the envelope. Fisce the envelope on the floor under your chair.
- Here is a set you may have seen on the breakfast table this morning. This is a set of dishes. The things in this set go together because they are all dishes. Every member of this set is a dish. The members of this set are two large plates, two small plates, two bowls and two cups. This is a set of dishes.
 - Here is another set you may have seen recently. You may have seen a set like this on the playground. Have you ever swung on a swing? This is a set of swings. Every member of this set is a swing. You can swing on every member of this set.
 - 7 This is one member of the set of swings. You can swing on this set member. Every member of this set is a swing. You can swing on every member of this set.
 - Beside your desk is a large envelope with the numeral one on it. Open the envelope. Put the three sheets of paper on your desk. There is one green sheet, one red sheet and one yellow sheet. Place the set of blocks on the green sheet. Place the set of dishes on the red sheet. Place the set of money on the yellow sheet.

- 106 Check your work. Do the three sets of yours look the same is the three sets in the picture. If your sets are not like the sets in the picture, change them to match the sets in the picture.
- You did very well. Now, put all of the things back into the envelope. Place the envelope on the floor under your chair.
- Have you ever had a pet?
- This set of pets has in it a dog, a cat, and a bird. The pets in this set are each a different color. The dog is brown. The cat is white and the bird is green. But the reason these animals are members of the set is because they are all pets.
- 10 The dog is a pet. Therefore, he is a member of the set of pets.
- 11 The cat is also a member of the set because he is a pet.
- The bird is also a member of the set because he is a pet.
- 9 The dog, the cat, and the bird make up the set of pets. Every member of the set of pets is a pet.
- Another set which you see every day is the set of boys. There are sets of boys in your classroom, aren't there? This set of boys has five members. Each boy has a different colored shirt. All of these boys are members of the set. They are all members of this set because they are all boys. A girl could not be a member of this set. Only boys can be members of this set. This is a set of boys.
- Now, I have a puzzle for you to solve. Find the envelope beside your desk with the numeral "2" on it. Open it and put all the things on your desk. Find all of the members of the set of 6 animals and place them on the yellow piece of paper. Find all of the members of the set of 3 puppets and place them on the blue sheet of paper. Be careful. There are some things that do not belong in either set. Place the things that do not belong in either set back in the envelope.
- 108 Check your work. Does the work on your desk look like what is in the picture? If it does not look the same, change it so that it matches the picture.
- You did very well. Put the things back into the envelope. Place the envelope on the floor under your chair.

- You probably saw this set today in your classroom. This is a set of books. Each of these books is a different color, but you can read every member of this set.
- You can read the red book. The red book is a member of the set. Any book could be a member of this set.
- 35 This green book is also a member of the set of books. You can read this green book.
- All of the books on this table are members of the set. This is a set of books.
- This baby would not be a member of the set of books. Only books can be members of this set.
- The set we are going to talk about now is the set of balls. Each ball is a different color. You can bounce every member of this set. You can roll every member of this set, and you can throw every member of this set.
- Here is one member of the set of balls. You can bounce this ball. You can roll this ball and you can throw this ball. This ball is a member of the set of balls.
- Now, find envelope number 3 beside your desk. Make three sets from the things you find in the envelope. Place the members of each of the three sets on a different piece of paper.
- 110 Check your work. Are these the sets you found? There is one set of 3 cars, one set of 3 dolls, and one set of 3 blocks.
- Fine, you are getting the idea. Now, put the things back in the envelope. Place the envelope on the floor under your chair.
- 1 Good-bye for now. I'll see you tomorrow and we'll do some more exploring in the basket of sets.

LESSON ONE: DEDUCTIVE-EXACT NON-MANIPULATIVE INTRODUCTION TO SETS

Hello! I want you to meet Mr. Mathematics. He's going to help me show you some things about mathematics which you may not have learned before. As you can see, he has three baskets of mathematics: numbers, shapes, and sets. In Mr. Mathematics' first basket are numbers. You probably know about this kind of mathematics. Sometimes we call this kind, arithmetic. There are two other kinds of mathematics in his basket. In Mr. Mathematics' second basket are shapes. In Mr. Mathematics' third basket are sets. We'll be exploring the mathematics in each of Mr. Mathematics' baskets. We'll be studying numbers, shapes and sets.

Today we are going to talk about some of the sets which you see every day. But what is a set? A set is a group of things which go together. We call these things in a set, members of the set.

- Here is a set you may have seen on the breakfast table this morning. This is a set of dishes. The things in this set go together because they are all dishes. Every member of this set is a dish. The members of this set are two large plates, two small plates, two bowls and two cups. This is a set of dishes.
- Here is another set you may have seen recently. You may have seen a set like this on the playground. Have you ever swung on a swing? This is a set of swings. Every member of this set is a swing. You can swing on every member of this set.
- 7 This is one member of the set of swings. You can swing on this set member. Every member of this set is a swing. You can swing on every member of this set.
- Beside your desk is a large envelope with the numeral one on it. Open the envelope. Take out the piece of paper and crayons. Color the members of the set of dishes red. Color the members of the set of blocks green. Color the members of the set of money yellow.
- 107 Check your work. Do your three sets look the same as the three sets in the picture. If your sets are not like the sets in the picture, change them to match the sets in the picture.
- You did very well. Put all of the things back into the envelope. Place the envolope on the floor under your chair.

4

- Have you ever had a pet?
- This set of pets has in it a dog, a cat, and a bird. The pets in this set are each a different color. The dog is brown. The cat is white and the bird is green. But the reason these animals are members of the set is because they are all pets.
- 10 The dog is a pet. Therefore, he is a member of the set of pets.
- 11 The cat is also a member of the set because he is a pet.
- The bird is also a member of the set because he is a pet.
- 9 The dog, the cat, and the bird make up the set of pets. Every member of the set of pets is a pet.
- Another set which you see every day is the set of boys. There are sets of boys in your classroom, aren't there? This set of boys has five members. Each boy has a different colored shirt. All of these boys are members of the set. They are all members of this set because they are all boys. A girl could not be a member of this set. Only boys can be members of this set. This is a set of boys.
- Now, I have a puzzle for you to solve. Find the envelope beside your desk with the numeral "2" on it. Open it and put all of the things on your desk. One piece of paper has pictures of many different things. Pick out all of the members of the set of animals and color them yellow. Pick out all of the members of the set of puppets and color them blue. Do not color the things on the paper that do not belong to either set.
- 109 Check your work. Does the work you have completed on your desk look the same as the picture. If it does not, change your work so that they match.
- You did very well. Put the things back into the envelope. Place the envelope on the floor under your chair.
- 33 You probably saw this set today in your classroom. This is a set of books. Each of these books is a different color, but you can read every member of this set.
- You can read the red book. The red book is a member of the set. Any book could be a member of this set.
- This green book is also a member of the set of books. You can read this green book.
- All of the books on this table are members of the set. This is a set of books.

- This baby would not be a member of the set of books. Only books can be members of this set.
- The set we are going to talk about now is the set of balls. Each ball is a different color. You can bounce every member of this set. You can roll every member of this set, and you can throw every member of this set.
- Here is one member of the set of balls. You can bounce this ball. You can roll this ball and you can throw this ball. This ball is a member of the set of balls.
- Now, find envelope number 3 beside your desk. Make three sets. Put an "X" on the members of one set. Put an "A" on the members of one set.
- lll Did you find sets like these? There is one set of 3 cars, one set of 3 dolls, and one set of 3 blocks.
- Fine, you are getting the idea. Now, put the things back in the envelope. Place the envelope on the floor under your chair.
- Here is a set you may have seen on the breakfast table this morning. This is a set of dishes. The things in this set go together because they are all dishes. Every member of this set is a dish. The members of this set are two large plates, two small plates, two bowls and two cups. This is a set of dishes.
- 6 Here is another set you may have seen recently. You may have seen a set like this on the playground. Have you ever swung on a swing? This is a set of swings. Every member of this set is a swing. You can swing on every member of this set.
- 7 This is one member of the set of swings. You can swing on this set member. Every member of this set is a swing. You can swing on every member of this set.
- Beside your desk is a large envelope with the numeral one on it. Open the envelope. Take out the piece of paper and crayons. Color the members of the set of dishes red. Color the members of the set of blocks green. Color the members of the set of money yellow.
- 107 Check your work. Do your three sets look the same as the three sets in the picture. If your sets are not like the sets in the picture, change them to match the sets in the picture.
- You did very well. Put all of the things back into the envelope. Place the envelope on the floor under your chair.

 $\cdots, a_{H^{n}}$

- Have you ever had a pet?
- This set of pets has in it a dog, a cat, and a bird. The pets in this set are each a different color. The dog is brown. The cat is white and the bird is green. But the reason these animals are members of the set is because they are all pets.
- 10 The dog is a pet. Therefore, he is a member of the set of pets.
- The cat is also a member of the set because he is a pet.
- The bird is also a member of the set because he is a pet.
- The dog, the cat, and the bird make up the set of pets. Every member of the set of pets is a pet.
- Another set which you see every day is the set of boys. There are sets of boys in your classroom, aren't there? This set of boys has five members. Each boy has a different colored shirt. All of these boys are members of the set. They are all members of this set because they are all boys. A girl could not be a member of this set. Only boys can be members of this set. This is a set of boys.
- Now, I have a puzzle for you to solve. Find the envelope beside your desk with the numeral "2" on it. Open it and put all of the things on your desk. One piece of paper has pictures of many different things. Pick out all of the members of the set of animals and color them yellow. Pick out all of the members of the set of puppets and color them blue. Do not color the things on the paper that do not belong to either set.
- 109 Check your work. Does the work you have completed on your desk look the same as the picture. If it does not, change your work so that they match.
- You did very well. Put the things back into the envelope. Place the envelope on the floor under your chair.
- 33 You probably saw this set today in your classroom. This is a set of books. Each of these books is a different color, but you can read every member of this set.
- You can read the red book. The red book is a member of the set. Any book could be a member of this set.
- This green book is also a member of the set of books. You can read this green book.

iv

- 33 All of the books on this table are members of the set. This is a set of books.
- This baby would not be a member of the set of books. Only books can be members of this set.
- The set we are going to talk about now is the set of balls. Each ball is a different color. You can bounce every member of this set. You can roll every member of this set, and you can throw every member of this set.
- Here is one member of the set of balls. You can bounce this ball. You can roll this ball and you can throw this ball. This ball is a member of the set of balls.
- Now find envelope number 3 beside your desk. Make three sets. Put an "X" on the members of one set. Put an "A" on the members of one set. Put an "O" on the members of one set.
- lll Did you find sets like these? There is one set of 3 cars, one set of 3 dolls, and one set of 3 blocks.
- Fine, you are getting the idea. Now, put the things back in the envelope. Place the envelope on the floor under your chair.
- 1 Good-bye for now. I'll see you tomorrow and we'll do some more exploring in the basket of sets.

APPENDIX III.

INVENTORY FOR THE ASSESSMENT
OF MATHEMATICAL PERFORMANCE
OF EMR'S AT SIX COGNITIVE LEVELS

EMR MATHEMATICS POST TEST -- PART A

#53 Hello there. Today Mr. Mathematics would like to find out how much mathematics you remember from the last few weeks.

#3000 You remember Mr. Mathematic's friend, Mr. Question. He is going to ask you some questions about mathematics, just like he did when we started the program. Again, you are not expected to answer all of the questions correctly. Just answer as many of them as you can. You may guess at answers you are not sure of. Now find your question envelope. It is in the upper right hand corner of your desk. (stop) Open the envelope and put the cards on your desk, with the card numbered p-one on top. (stop)

#3001 On your desk you will also find an answer sheet that looks like this. Find the small box on your answer sheet.

#3002 It is shown in red in the picture. Put your finger on the numeral one in the small answer box. (stop) For each question asked, you will have four different answers to choose from. If you choose answer A, blacken the space under A with your pencil. If you choose answer B, blacken the space under B. If you choose answer C, blacken the space under C. If you choose answer D, blacken the space under D. Follow these directions for every question you answer. Now, take card p-one from your pile of question cards. Turn it over. (stop) Read the question to yourself as I read it to you.

P.I. Which of the pets is a dog? (2 sec. pause)

```
picture A. (#11 cat) (4 sec. pause)
picture B. (#12 bird) (4 sec. pause)
picture C. (#10 dog) (4 sec. pause)
picture D. (#304 fish) (4 sec. pause)
```

#3000 Remember, if your answer is A, blacken the space under A. If your answer is B, blacken the space under B. If your answer is C, blacken the space under C. If your answer is D, blacken the space under D. (stop)

#3003 Is this the answer you marked? You should have blackened the space under the letter C. (stop)

#3000 Now take the card that you have just finished and place it, with the question facing up, in the lower right hand corner of your desk. (stop) Whenever you answer a question, place the card, with the question facing up, on the pile in the corner of your desk. Now, put your finger on the numeral 2 in the small box. Find card p-two. Turn it over. (stop) Read the question to yourself as I read it to you.

P.2. Which of the following is a set of horses? (2 sec. pause)

```
picture A. (#737 horses) (4 sec. pause)
picture B. (#93 fish) (4 sec. pause)
picture C. (#738 chickens) (4 sec. pause)
picture D. (#81 birds) (4 sec. pause)
```

If your answer is A, blacken the space under A. If your answer is #3000 B, blacken the space under B. If your answer is C, blacken the space under C. If your answer is D, blacken the space under D. (stop) Check your work. Did you blacken the space under A? If so, you *#*3004 were correct. (stop) Now find the large box on your answer sheet. Find number one. #3000 You will answer all of the rest of the questions just as you have done these practice questions. Turn card one over and read it to yourself as I read it Ready? Let's do question one. 1. Which of the following pictures shows an object which would (L1-A) not be in the set of fruit? (2 sec. pause) (#17 apple) (4 sec. pause) picture A. (#18 orange) (4 sec, pause) picture B. (#20 grapes) (4 sec. pause) picture C. (#44 pencil) (4 sec. pause) picture D. #3000(stop)Let's try the next question. Turn card 2 over. (L9-K)2. What does this symbol (#2615) stand for? (4 sec. pause) Α. is equal to (2 sec. pause) is not equal to (2 sec. pause) В. (2 sec. pause) is equivalent to (2 sec. pause) is greater than #3000(stop)Let's try the next question. Turn card 3 over. Which picture shows a set that this numeral (#4820: 0) does not represent? (7 sec. pause) hundreds tens (L12-E) (#2g set of 8 dishes) picture A. (7 sec. pause) (#494 ten red dots) picture B. (7 sec. pause) (#498 ten unit sticks) (7 sec. pause) picture C. (#46 ten balls) (7 sec. pause) picture D. #3000(stop)Let's try the next question. Turn card 4 over. (stop) (L1-AP) 4. Which picture shows an element that would <u>not</u> be a member of the set of pets? (2 sec. pause)

(#9 set of pets)

(#11 cat)

(#12 bird) (#47 ball) (4 sec. pause)

(4 sec. pause) (4 sec. pause)

(4 sec. pause)

picture A.

picture B.

picture C.

picture D.

```
(L4-A)
           5. This set is a subset of which picture? (#201 girls) (4 sec. pause)
                            (#199 boys)
                                            (4 sec. pause)
                picture A.
                            (#203 tall children) (4 sec. pause)
                picture B.
                            (#205 short children) (4 sec. pause)
                picture C.
                            (#198 children) (4 sec. pause)
                picture D.
#3000(stop)Let's try the next question. Turn card 6 over. (stop).
(L5-C)
           6. Which picture shows a pair of equivalent sets: (2 sec. pause)
                            (#2669 4 faces/6 hats) (7 sec. pause)
                picture A.
                            (#261 8 helmets/ 8 heads) (7 sec. pause)
                picture B.
                            (#307 3 girls/ 5 boys) (7 sec. pause)
                            (#703 train 8 car/3 pets) (7 sec. pause)
                picture D.
#3000(stop)Let's try the next question. Turn card 7 over.
                                                              (stop)
           7. What is the answer to this addition problem?
(L17-AP)
                                                             (#912 068
               (4 sec. pause)
                                                                    +926
                    1084
                            (2 sec. pause)
                    994
                            (2 sec. pause)
                    1021
                            (2 sec. pause)
                    984
                            (2 sec. pause)
#3000(stop)Let's try the next question. Turn card 8 over. (stop)
(L5-K)
           8. Equivalent sets are two sets: (2 sec. pause)
                A. with the same number of members.
                                                                (2 sec. pause)
                                                                (2 sec. pause)
                B. with the same members.
                C. with some but not all of the same members. (2 sec. pause)
                   which are the same length.
                                                                (2 sec. pause)
#3000(stop)Let's try the next question. Turn card 9 over.
(L20-AP)
              Which picture shows a pair of shapes that are not congruent?
               (2 sec. pause)
                           (#1141 red ≅ □'s)
(#1142 blue ≅ △'s)
                                                  (4 sec. pause)
               picture A.
                                                  (4 sec. pause)
               picture B.
                           (#1167 purple ‡ O's)
                                                  (4 sec. pause)
                           (#1144 yellow ± 0's)
               picture D.
                                                  (4 sec. pause)
#3000(stop)Let's try the next question. Turn card 10 over. (stop)
(L7-A)
           10. Which picture shows this relation: 3 < 5? (2 sec. pause)
                            (#752 3 cards/ 5 env.)
                picture A.
                                                      (7 sec. pause)
                            (#2645 9 umb./3 birds ) (7 sec. pause)
                picture B.
                            (#2677 8 watches/8 dishes) (7 sec. pause)
                picture C.
                picture D.
                            (#2669 4 faces/6 hats) (7 sec. pause)
```

#3000(stop)Let's try the next question. Turn card 5 over. (stop)

ERIC
Full Text Provided by ERIC

```
#3000(stop)Let's try the next question. Turn card 11 over. (stop)
           11. What does this sign mean? (#2601 =) (4 sec. pause)
(L6-K)
                Α.
                   is not equal to.
                                               (2 sec. pause)
                                               (2 sec. pause)
                    is equal to.
                В.
                                               (2 sec. pause)
                    is a subset of.
                                               (2 sec. pause)
                    is equivalent to.
#3000(stop)Let's try the next question. Turn card 12 over. (stop)
           12. Which could not be members of a subset of this set: (#143 socks)
(L4-E)
                (4 sec. pause)
                            (#144 short socks)
                                                (4 sec. pause)
                picture A.
                            (#146 red socks)
                                                (4 sec. pause)
                picture B.
                            (#145 long socks)
                                                (4 sec. pause)
                picture C.
                            (#151 blouses)
                picture D.
                                                (4 sec. pause)
#3000(stop)Let's try the next question. Turn card 13 over.
                Sarah found 7 hundreds, 4 tens and 14 units for an answer to
(L15-S)
                this problem. (#953 516) What did she do wrong? Sarah did
                not: (4 sec. pause) +238
                    regroup the hundreds to give I thousands and 3 hundreds
                    (2 sec. pause)
                    regroup the tens to give 4 hundreds and 1 ten. (2 sec. pause)
                В.
                    regroup the units to give 1 ten and 4 units. (2 sec. pause)
                    regroup the hundreds to give units and tens. (2 sec. pause)
#3000(stop)Let's try the next question. Turn card 14 over. (stop)
           14. Look carefully at these shapes. (#1156a □ △□○□)
(L19-S)
               Which two shapes in the picture are congruent? (4 sec. pause)
                    circle and triangle
                                             (2 sec. pause)
                                             (2 sec. pause)
                В.
                    rectangle and square
                                             (2 sec. pause)
                    circle and square
                    rectangle and rectangle (2 sec. pause)
#3000(stop)Let's try one more question. Turn card 15 over. (stop)
(L3-E)
           15. Which picture shows a set which could <u>not</u> be a subset of this
                set: (#198 children) (4 sec. pause)
                            (#199 boys)
                picture A.
                                                      (4 sec. pause)
                            (#201 girls)
                                                      (4 sec. pause)
                picture B.
                            (#208 black cats)
                picture C.
                                                      (4 sec. pause)
                picture D. (#205 short children)
                                                      (4 sec. pause)
#3000(stop)You did a very good job of answering the questions. | 111 see you
```

ERIC

tomorrow when we'll answer some more of Mr. Question's questions.

Good bye for now. (stop)

EMR MATHEMATICS POST TEST -- PART B

#3000 Here's Mr. Question again. You remember him from yesterday. Today we're going to answer more of his questions. Remember how we blackened our answers in the spaces in the large box? Do the same thing today. Now, find your question envelope in the upper right hand corner of your desk. (stop) Card number 16 should be on top of the pile. When you are finished with one question, put that card in the lower right hand corner of your desk, with the question facing up, like you did yesterday. Ready to begin? Turn card number 16 over. Put your finger on numeral 16 in the large answer box, where we left off yesterday. (stop) Now, read card 16 to yourself as I read it to you.

#960 Tommy found 5 hundreds, 11 tens and six units as his answer (L16-S) to this addition problem. What did he do wrong? (4 sec. pause) Tommy did not:

365 +<u>25</u>1

- regroup the 11 tens as 1 hundred and 1 ten. (2 sec. pause)
- regroup the 6 units as 1 ten. (2 sec. pause)
- add right: 6 plus 5 is not equal to eleven. (2 sec. pause) C.
- D. add the units right. (2 sec. pause)

#3000(stop)Now let's try another question. Turn card 17 over. (stop) #546

(L13-AP) 17. What is another name for the number represented here? (4 sec.pause)

- 3 hundreds, 4 tens, 1 unit (2 sec. pause)
- 3 hundreds, 3 tens, 2 units (2 sec. pause)
 3 hundreds, 2 tens, 10 units (2 sec. pause)
 3 hundreds, 4 tens, 2 units (2 sec. pause)

#3000(stop)Let's try another question. Turn card 18 over. (stop)

(L18-C) 18. Which picture shows a triangular region? (2 sec. pause)

```
#1111 🛆
                     (4 sec. pause)
picture A.
           #1112 0
                     (4 sec. pause)
picture B.
           #1115 🛆
picture C.
                     (4 sec. pause)
picture D.
           #1071
                     (4 sec. pause)
```

#3000(stop)Let's try the next question. Turn card 19 over.

(L8-A) 19. Which picture shows this relation: 4 > 2? (2 sec. pause)

```
#739 4 horses/3 chickens (7 sec. pause)
picture A.
picture B. #756 5 hands/4 glasses of milk (7 sec. pause)
picture C. #723 4 flower/2 children (7 sec. pause)
picture D. #752 3 cards/5 envelopes (7 sec. pause)
```

```
#3000(stop)Let's try the next question. Turn card 20 over. (stop)
                 Which sentence is a true statement about the relation between
(L7-AP)
           20.
                 eight and six? (2 sec. pause)
                     8 = 6
                               (2 sec. pause)
                 B. 8 < 6
c. 6 < 8
                               (2 sec. pause)
                               (2 sec. pause)
                               (2 sec. pause)
#3000(stop)Let's try the next question. Turn card 21 over. (stop)
(L4-C)
           21. Which picture shows a set and one of its subsets? (2 sec. pause)
                              #136 hands and feet/hands (4 sec. pause)
                 picture A.
                 picture B. #253 4 gl. milk/4 cookies (4 sec. pause)
picture C. #323 golf clubs/ tennis rackets (4 sec. pause)
picture D. #388 doll/ truck, ball (4 sec. pause)
#3000(stop)Let's try the next question. Turn card 22 over. (stop)
(L19-AP)
           22.
                 Which picture shows a pair of shapes that are congruent?
                 (2 sec. pause)
                 picture A. #1094 ___ (4 sec. pause)
                 picture B. #1093 (4 sec. pause)
picture C. #1165 (4 sec. pause)
picture D. #1096 (4 sec. pause)
#3000(stop)Let's try the next question. Turn card 23 over. (stop)
(L5-A)
           23.
                 These two sets are equivalent sets because (#2637 combs <->
                 rubberbands) (4 sec. pause)
                      there is a comb for every rubberband and a rubberband for
                      every comb (2 sec. pause)
                      there is a comb for every rubberband
                                                                (2 sec. pause)
                                                                (2 sec. pause)
                      there is a rubberband for every comb
                      there are arrows drawn between them
                                                                (2 sec. pause)
#3000(stop)Let's try the next question. Turn card 24 over. (stop)
(L15-C)
           24. The sum of six and seven is thirteen because (2 sec. pause)
                      six things when put together with seven things makes
                      thirteen things altogether.
                                                       (2 sec. pause)
                                                       (2 sec. pause)
                     it is a rule.
                 C. six written next to seven makes 67 which is like 13.
                      (2 sec. pause)
                 D. six sevens makes thirteen. (2 sec. pause)
```

```
#3000(stop)Let's try the next question. Turn card 25 over. (stop)
           25. Which pair of numbers is not equal to each other? (2 sec. pause)
(L6-AP)
                    4 and 4
                               (2 sec. pause)
                    5 and 5
                               (2 sec. pause)
                B.
                    7 and 8
                               (2 sec. pause)
                              (2 sec. pause)
                    6 and 6
#3000(stop)Let's try the next question. Turn card 26 over. (stop)
(L5-AP)
                Which picture shows two sets which have the same number of
           26.
                members (2 sec. pause)
                picture A. #326 1 baby and 2 bottles (7 sec. pause)
                picture B. #727 2 children holding 4 flowers (7 sec. pause)
                            #730 7 comb 6 toothbrushes (7 sec. pause)
                picture C.
                picture D. #2633 6 fish on 6 lines (7 sec. pause)
#3000(stop)Let's try the next question. Turn card 27 over. (stop)
(L8-E)
           27. Which sentence is <u>not</u> a true greater than statement?
                (2 sec. pause)
                            (2 sec. pause)
               B. 6>4
C. 6>7
D. 9>8
                            (2 sec. pause)
                            (2 sec. pause)
                            (2 sec. pause)
#3000(stop)Let's try the next question. Turn card 28 over. (stop)
(Li5-AP)
           28. What is the answer to this problem? #910 732 (4 sec. pause)
                                                           +148
                    710
                          (2 sec. pause)
                          (2 sec. pause)
                    870
                          (2 sec. pause)
                    880
                C.
                    881
                          (2 sec. pasue)
                D.
#3000(stop)Let's try the next question. Turn card 29 over. (stop)
(L10-A)
           29.
                An object which would not be in the new set when these two
                sets (#308 4 fruits/2 pieces of pie) are unioned is shown in:
                (4 sec. pause)
                            #79 2 pieces of pie (4 sec. pause)
                picture A.
                            #17 apple
#19 banana
                                                   (4 sec. pause)
                picture B.
                                                   (4 sec. pause)
                picture C.
```

(4 sec. pause)

#251 cookies

picture D.

#3000(stop)Let's try the last question. Turn card 30 over. (stop)

(L18-E) 30. How do we know that this shape (#1074) is a circle? It has: (4 sec. pause)

- A. three sides (2 sec. pause)
- B. four sides (2 sec. pause)
- C. curved sides (2 sec. pause)
- D. two sides (2 sec. pause)

#3000(stop)Again, you did a good job of answering the question and checking your answers. I'll see you tomorrow when we'll answer some more questions. See you then. (stop)

EMR MATHEMATICS POST TEST--PART C

#3000 Hello there. Here's Mr. Question again. Today he's noing to ask you some more questions about the mathematics you've learned. You've done very well so far. Just keep in mind that we answer the questions by blackening the space under the letter of the answer we want. Also remember to read the questions to yourself as Mr. Question reads them to you. Now take your question envelope from the upper right hand corner of your desk. Take the cards out. (stop) Card number 31 should be on top of the pile. Find number 31, where we left off yesterday, on your answer sheet. Ready to begin? Turn card 31 over. (stop)

(L8-S) 31. Look at these two sets: (#748 9 fish/1 fish)

Which sentence is a true statement about these two sets? (7 sec. pause)

- A. 2 > 10 (2 sec. pause)
- B. 2 < 10 (2 sec. pause)
- C. 9 > 1 (2 sec. pause)
- D. 1 < 9 (2 sec. pause)

#3000(stop)Let's try the next question. Turn card 32 over. (stop)

- (L1-E) 32. (#102 cat, dish, ball, girl) Why is this group of objects not a set? (4 sec. pause)
 - A. a set can only have three members. (2 sec. pause)
 - B. the members of this group do not go together. (2 sec. pause)
 - C. the members of this goup are different colors. (2 sec. pause)
 - D. a set does not have any members. (2 sec. pause)

#3000(stop)Let's try the next question. Turn card 33 over. (stop)

(L2-A) 33. Which picture shows a set which does not have the same number of members as this set? (#87 6 hands) (7 sec. pause)

picture A. (#68 6 footballs) (7 sec. pause)

picture B. (#72 7 airplanes) (7 sec. pause)

picture C. (#125 6 balloons) (7 sec. pause)

picture D. (#270 6 dowels) (7 sec. pause)

#3000(stop) Let's try the next question. Turn card 34 over. (stop)

(L20-S) 34. Which picture shows a pair of shapes that are congruent? (2 sec. pause)

picture A. (#1169 □ □ yellow) (4 sec. pause)

picture B. (#1172 🛆 🐧 orange) (4 sec. pause)

picture C. (#1167 O purple) (4 sec. pause)

picture D. (#1170 00 orange) (4 sec. pause)

```
(L14-A)
          35. Fifty tens is the same as five (2 sec. pause)
                    tens and fifty units
                                             (2 sec. pause)
                    hundreds
                                             (2 sec. pause)
                    units
                                             (2 sec. pause)
                    hundred tens
                                             (2 sec. pause)
  (stop) Let's try the next question. Turn card 36 over.
                                                               (stop)
(L6-C)
          36. Which of the following pairs of numbers are not equal to one
               another? ( sec. pause)
                                        (2 sec. pause)
                   6, 6
               В.
                                        (2 sec. pause)
                   8, 8
                                        (2 sec. pause)
                   9.8
                                        (2 sec. pause)
  (stop) Let's try the next question. Turn card 37 over. (stop)
               (#1149 \triangle blue \triangle blue) Why are these two shapes congruent?
(L20-E)
               They are the same
                                       (4 sec. pause)
                  color.
                                        (2 sec. pause)
               B. size.
                                        (2 sec. pause)
                                        (2 sec. pause)
               C. shape.
                                        (2 sec. pause)
                    size and shape
#3000(Stop)Let's try the next question. Turn card 38 over. (stop)
(L2-S)
          38.
               (#2679 4 spoons) How many members are in this set? (7 sec. pause)
                   5 (five)
                                        (2 sec. pause)
                    6 (six)
                                        (2 sec. pause)
                   4 (four)
                                        (2 sec. pause)
                   9 (nine)
                                       (2 sec. pause)
#3000(stop) Let's try the next question. Turn card 39 over. (stop)
(L9-A)
               Which picture shows these relations:
                   8, 7
                           8, 8
                                  7? (2 sec. pause)
               picture A.
                            #800
                                  5 bl. and 9 bl.
                                                    (4 sec. pause)
                                                    (4 sec. pause)
                            #833
                                  7 bl. and 8 bl.
               picture B.
               picture C.
                            #831
                                  7 bl. and 3 bl.
                                                    (4 sec. pause)
                            #830 4 bl. and 5 bl.
               picture D.
                                                    (4 sec. pause)
#3000(Stop)Let's try the next question. Turn card 40 over.
(L13-K)
          40. Ten units is equal to
                                                    (2 sec. pause)
                   1 ten
                                       (2 sec. pause)
                  2 tens
                                       (2 sec. pause)
               C.
                   1 hundred
                                       (2 sec. pause)
                    10 tens
                                       (2 sec. pause)
```

#3000(stop) Let's try the next question. Turn card 35 over. (stop)

```
Let's try the next question. Turn card 41 over. (stop)
(stop)
               This is the new set (#368 doll, truck, ball, children)
(L11-E)
               (4 sec. pause) when these two sets (#366 child/toys) are unioned
               because it (4 sec. pause)
                   contains all of the members of the two sets. (2 sec. pause)
                   contains some but not all of the members of the two sets.
                   (2 sec. pause)
                   is smaller than the two sets.
                                                  (2 sec. pause)
                   is larger than the two sets.
                                                  (2 sec. pause)
#3000(stop)Let's try the next question. Turn card 42 over. (stop)
         42. What does this symbol (#2664 \angle ) stand for? (4 sec. pause)
(L7-K)
                                      (2 sec. pause)
               A. is equal to
               B. is a subset of
                                      (2 sec. pause)
               C. is greater than
                                      (2 sec. pause)
                                      (2 sec. pause)
                   is less than
#3000(stop) Let's try the next question. Turn card 43 over. (stop)
(L11-AP) 43. Union these two sets: (#373 4 faces/ 6 hats)
               Which picture shows the new set? (4 sec. pause)
                                  4 faces)
                                            (4 sec. pause)
                           (#371
               picture A.
                           (#372
                                  6 hats)
                                            (4 sec. pause)
               picture B.
                                  faces and hats) (4 sec. pause)
               picture C.
                           (#374
                           (#151
                                 blouses) (4 sec. pause)
               picture D.
#3000(stop)Let's try the next question. Turn card 44 over. (stop)
(L9-S)
         44. Look carefully at this picture: (#831 7 blocks and 3 blocks)
               Which number sentence tells about this picture? (7 sec. pause)
               A. 7 = 3
                                      (2 sec. pause)
               B. 3 > 7
                                      (2 sec. pause)
                                      (2 sec. pause)
               C. 7 = 3
                                      (2 sec. pause)
#3000(stop)Let's try one more question. Turn card 45 over. (stop)
                      059
(L16-AP) 45.
               (#956 +763 ) Find the answer to this problem. The correct
               answer is
                            (4 sec. pause)
               A. 812
                                      (2 sec. pause)
               B. 831
                                      (2 sec. pause)
                   822
                                      (2 sec. pause)
               D. 723
                                      (2 sec. pause)
```

#3000(stop) You have done a very good job of answering the questions. See you tomorrow when Mr. Question will be back again. Good bye for now. (stop)

EMR MATHEMATICS POST TEST -- PART D

- Hello there. Here's Mr. Question again. Today he's going to ask #3000 you some more questions about the mathematics you've learned. You've done a very good job so far. Just keep in mind that we answer the questions by blackening the space under the letter of the answer we want. Also remember to read the questions to yourself as Mr. Question reads them to you. Now take your question envelope from the upper right hand corner of your desk. (stop) Take the cards out. Card number 46 should be on top of the pile. Find number 46, where we left off yesterday, on your answer sheet. (stop) Ready to begin? Turn card 46 over.
- (L3-K)46. A subset is (2 sec. pause)
 - A. a set which is part of another set. (2 sec. pause)
 - B. the number which tells how many members the set has. (2 sec.pause
 - C. an empty set. (2 sec. pause)
 - a set which has the same number of members as another set. (2 sec. pause)
- Let's try the next question. Turn card 47 over. (stop) (stop)
- (L10-K) 47. To union two sets means (2 sec. pause)
 - A. to put the members of the two sets together to make a new set. (2 sec. pause)
 - to make a new set by adding some but not all of the members of another set. (2 sec. pause)
 - to choose some of the members of a set and put them into a new set. (2 sec. pause)
 - to count the members in the sets. (2 sec. pause)
- Let's try the next question. Turn card 48 over. (stop) (stop)
- (L14-K) 48. Ten tens is equal to (2 sec. pause)
 - Α. 10 units (2 sec. pause)
 - 1 hundred (2 sec. pause) В.
 - (2 sec. pause) 10 hundreds
 - (2 sec. pause) 15 units
- (stop) Let's try the next question. Turn card 49 over. (stop)
- (L10-E) Which picture shows two sets which were not unioned to get this set? (#364 doll, truck, ball) (4 sec. pause)
 - (#387 toys/ \$?) (#388 doll/truck, ball) picture A. (4 sec. pause)
 - picture B. (4 sec. pause)
 - (#389 doll, truck/ball) picture C. (4 sec. pause)
 - (#369 truck, ball, doll, boy and girl) (4 sec. pause) picture D.

```
#3000(stop)Let's try the next question. Turn card 50 over.
                                                                 (stop)
                We can regroup fourteen tens as one hundred and 4 tens because
(L13-E)
                 (2 sec. pause)
                     14 = 14
                Α.
                                                (2 sec. pause)
                                                (2 sec. pause)
                     10 \text{ tens} = 1 \text{ hundred}
                     10 hundreds = 1 ten
                                                (2 sec. pause)
                     10 \text{ units} = 1 \text{ ten}
                                                (2 sec. pause)
                                                                 (stop)
(stop)
           Let's try the next question. Turn card 51 over.
                                            (2 sec. pause)
(L17-K)
           51. Five plus six equals
                     eleven (11)
                                          (2 sec. pause)
                     ten (10)
                                          (2 sec. pause)
                 В.
                                          (2 sec. pause)
                     seven (7)
                                          (2 sec. pause)
                     twelve (12)
                                                                (stop)
           Let's try the next question. Turn card 52 over.
(stop)
           52. Which picture shows a set and one of its subsets? (2 sec. pause)
(L3-C)
                              (#316 sailboats/lifejackets)
                                                                 (4 sec. pause)
                picture A.
                              (#192 dishes/ large plates)
                picture B.
                                                                 (4 sec. pause)
                              (#271 holes/dowels)
                                                                 (4 sec. pause)
                 picture C.
                                                                 (4 sec. pause)
                              (#366 children/toys)
                picture D.
#3000(stop)Let's try the next question. Turn card 53 over.
                                                                 (stop)
(L19-C)
           53. Which picture shows a pair of shapes that are congruent.
                 (2 sec. pause)
                              (#1109
                                                       (4 sec. pause)
                 picture A.
                                                       (4 sec. pause)
                 picture B.
                              (#1108
                                                       (4 sec. pause)
                 picture C.
                              (#1110
                picture D.
                              (#1144
                                                       (4 sec. pause)
#3000(stop)Let's try the next question. Turn card 54 over. (stop)
(L17-S)
                The answer to this problem (#950 238) (4 sec. pause) and this
           54.
                problem (#953 516)
                                                           (4 sec. pause) is
                                                    ÷516
                               +238
                     754
                          (2 sec. pause)
                     744
                          (2 sec. pause)
                     854
                          (2 sec. pause)
```

(2 sec. pause)

745

```
#3000(stop)Let's try the next question. Turn card 55 over.
            55. To find the number of members in a set, I would (2 sec pause)
(L2-C)
                      add the members. (2 sec. pause)
                  B. subtract the members. (2 sec. pause)
                      put the members together to make a new set. (2 sec. pause)
                  D. count the members. (2 sec. pause)
            Let's try the next question. Turn card 56 over. (stop)
(stop)
            56. (#546 hundreds tens units) A name for this number is (4 sec. pause)
(L12-S)
                      3 hundreds, 2 tens, 14 units (2 sec. pause)
                  B. 3 hundreds, 3 tens, 2 units (2 sec. pause)C. 3 hundreds, 3 tens, 3 units (2 sec. pause)
                     3 hundreds, 3 tens, 0 units (2 sec. pause)
#3000(stop)Let's try the next question. Turn card 57 over. (stop)
(L18-K)
            57. A triangle is a shape with (2 sec. pause)
                      four equal sides. (2 sec. pause)
                  Α.
                  B. three sides. (2 sec. pasue)
                  C. no sides. (2 sec. pause)
                      two pairs of equal sides. (2 sec. pause)
(stop)
            Let's try the next question. Turn card 58 over. (stop)
(L12-C)
            58. A "2" in the tens place means we have how many things in our
                  set? (2 sec. pause)
                      two (2). (2 sec. pause)
                      twenty (20). (2 sec1 pause) two-hundred (200). (2 sec. pause)
                      twelve (12). (2 sec. pause)
(stop)
            Let's try the next question. Turn card 59 over. (stop)
(L16-A)
            59. The sum of nine and five is (2 sec. pause)
                 A. I ten and 4 units. (2 sec. pause)
B. 2 tens and 4 units. (2 sec. pause)
C. 2 tens and 4 units. (2 sec. pause)
D. 9 tens and 5 units. (2 sec. pause)
```

- (stop) Let's try the next question. Turn card 60 over. (stop)
- (L11-C) 60. The new set formed when (#373 4 faces/6 hats) these two sets are unioned is shown in: (4 sec. pause)

```
picture A. (#375 4 faces, 6 hats) (4 sec. pause)
```

picture B. (#372 6 hats) (4 sec. pause)

picture C. (#371 4 faces) (4 sec. pause)

picture D. (#313 2 men/2 trucks) (4 sec. pause)

- #3000(stop)Let's try the last question. Turn card 61 over. (stop)
- (L14-S) 61. A name for this number is: (#622 I hundred block, 6 ten blocks, 3 unit blocks) (4 sec. pause)
 - A. 153 (2 sec. pause)
 - B. 162 (2 sec. pause)
 - C. 063 (2 sec. pause)
 - D. 163 (2 sec. pause)
- #3000(stop)Now, you have finished the test and all of the lessons. You have done an excellent job of showing Mr. Question how much mathematics you've learned. You have also been a very good pupil for all of the lessons. We hope to see you again soon. Until then, good bye.
